

REQUEST FOR COUNCIL ACTION

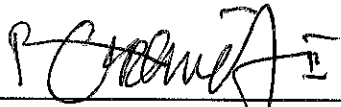

CITY COUNCIL MEETING DATE:

JUNE 19, 2018

TITLE:

**ADOPT A RESOLUTION TO MAINTAIN
MEASURE M2 FUNDING ELIGIBILITY BY
APPROVING A PAVEMENT
MANAGEMENT PLAN UPDATE
{STRATEGIC PLAN NO. 6, 1A, B, F, G}**

CITY MANAGER

CLERK OF COUNCIL USE ONLY:

APPROVED

- ☐ As Recommended
- ☐ As Amended
- ☐ Ordinance on 1st Reading
- ☐ Ordinance on 2nd Reading
- ☐ Implementing Resolution
- ☐ Set Public Hearing For _____

CONTINUED TO _____

FILE NUMBER _____

RECOMMENDED ACTION

Adopt a Resolution confirming the status and update of the Pavement Management Plan (PMP) per Orange County Transportation Authority (OCTA) 2018-19 Measure M2 eligibility requirements.

DISCUSSION

In November 1990, Orange County voters approved Measure M, a one-half cent sales tax increase for 20 years, to fund transportation projects in Orange County. Sixteen years later, in November 2006, the voters again approved the Renewal of Measure M, referred to as M2 for an additional thirty years. M2 became effective in April 2011, and the net revenues generated by M2 contribute to two (2) types of funding: Local Fair Share (LFS) and Competitive. All Orange County cities are eligible for LFS funding which is distributed on a formula-based allocation determined by population, number of existing Master Plan of Arterial Highways centerline miles, and taxable sales. However, under the competitive component of the M2 funding, Cities must compete and be successful to receive grant monies. Fulfilling M2 eligibility requirements will also allow the City to qualify for other regional competitive M2 grant funding opportunities.

The Orange County Transportation Authority (OCTA) determines annual eligibility for M2 funds based upon specific elements that cities must meet prior to June 30 of every year. In order to maintain M2 eligibility for Fiscal Year 2018-19 (FY18-19), the City must update and adopt via Resolution, a Pavement Management Plan (PMP) biennially. The PMP is the City's strategic plan to manage the preservation, rehabilitation, and maintenance of paved roads by analyzing pavement life cycles, assessing overall system performance costs, and determining alternative strategies and costs necessary to improve paved roads. A copy of this PMP with a certification must be submitted to OCTA by June 29, 2018.

STRATEGIC PLAN ALIGNMENT

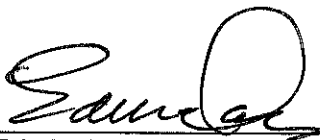

Approval of this item supports the City's efforts to meet Goal #6 - Community Facilities & Infrastructure, Objective #1 (establish and maintain a Community Investment Plan for all City assets), Strategy A (Develop a complete inventory of all assets to determine the scope of improvements needed to sustain the City's current infrastructure investment); Strategy B (Equitably maintain existing streets and associated assets in a state of good repair so they are clean, safe and aesthetically pleasing for all users); Strategy F (Perform periodic measurements to monitor and update each asset's condition and ensure adequate funding for repair and/or replacement costs in future budgets); and Strategy G (develop and implement the City's Capital Improvement Program in coordination with the Community Investment and Deferred Maintenance Plans).

ENVIRONMENTAL IMPACT

There is no environmental impact associated with this action.

FISCAL IMPACT

The recommended actions will continue the City's eligibility to receive Measure M2 funds. Upon meeting OCTA eligibility requirements, the City of Santa Ana is anticipated to receive an estimated \$4.8 million in LFS funds and \$15.2 million in M2 competitive funds for FY 2018-19. In the past, the City has received an average of \$20 million in combined annual revenue from M2 LFS and competitive fund program allocations.

Edwin "William" Galv  z, P.E.
Acting Executive Director
Public Works Agency

RESOLUTION NO. 2018-XXX

A RESOLUTION OF THE CITY COUNCIL OF THE CITY
OF SANTA ANA CONCERNING THE STATUS AND
UPDATE OF THE PAVEMENT MANAGEMENT PLAN
FOR THE MEASURE M2 (M2) PROGRAM

BE IT RESOLVED BY THE CITY COUNCIL OF THE CITY OF SANTA ANA AS
FOLLOWS:

Section 1. The City Council of the City of Santa Ana hereby finds, determines
and declares as follows:

A. The City of Santa Ana is required to meet eligibility requirements and
submit eligibility verification packages to the Orange County Transportation Authority
("OCTA") in order to remain eligible to receive M2 funds.

B. The City of Santa Ana is required to adopt and update a Pavement
Management Plan ("PMP"), using the required format, regarding the status of road
pavement conditions and implementation of the PMP on a biennial basis.

C. The City of Santa Ana is required to provide a plan that manages the
preservation, rehabilitation, and maintenance of paved roads by analyzing pavement
life cycles, assessing overall system performance costs, and determining alternative
strategies and costs necessary to improve paved roads.

Section 2. The City Council hereby declares that the PMP is in conformance
with the PMP Submittal Template provided in the Countywide Pavement Management
Plan Guidelines.

Section 3. The City of Santa Ana hereby adopts a PMP and has provided an
updated PMP report, using the required format, to OCTA.

Section 4. The City Council authorizes the Executive Director of the Public
Works Agency, the City Engineer, or his or her designee to sign the PMP certification
form.

Section 5. This Resolution shall take effect immediately upon its adoption by
the City Council, and the Clerk of the Council shall attest to and certify the vote
adopting this Resolution.

ADOPTED this ____ day of _____, 2018.

Miguel A. Pulido
Mayor

APPROVED AS TO FORM:
Sonia R. Carvalho, City Attorney

EXECUTIVE SUMMARY

The City of Santa Ana (City) Public Works Agency utilizes StreetSaver and geographical information system (GIS) to develop the Pavement Management Program (PMP) to provide an accurate inventory of the current and projected pavement condition of all public roadways and to implement a seven-year roadway maintenance and rehabilitation (M&R) program to maximize the return from available existing funding for street pavement. The PMP's ultimate goal is to effectively strategize short and long-term usages of current and future limited funding to restore and maintain the entire street pavement network at "Good" condition or better.

The City currently manages 422.8 centerline miles of streets for a total of approximately 95.7 million square feet (SF) of paved surfaces. To be consistent with the City General Plan Circulation Element Master Plan of Streets and Highways and the Orange County Transportation Authority (OCTA) Master Plan of Arterial Highways (MPAH), the entire street pavement network is organized into two networks (arterial and local) depending on its functional classifications (i.e. major, primary, secondary, and collector arterial streets; residential and non-residential local streets). There are 106.2 centerline miles (25% of entire pavement network) in the arterial network and 316.6 centerline miles (75% of entire pavement network) in the local network. To assist planning maintenance needs, the streets are also arranged into over 4,300 sections and classified by surface types – Asphalt Concrete (AC) or Portland Cement Concrete (PCC).

Figure E-1: PCI Distribution for 2016 and 2018

Pavement condition inspections are performed biennially for both the arterial and local networks. Figure E-1 shows a comparison of the Pavement Condition Index (PCI) distribution between the 2016 and the 2018 inspections. The PCI is a numerical value ranging from 0 for deteriorated pavement with virtually no remaining life to 100 for new or recently rehabilitated pavement. Generally, the PCI value is expressed as an area-weighted PCI (PCI_{aw}) to provide a more representative value. A PCI value is computed for each street section based on the pavement distresses found within that section during an inspection. Inspections provide the data utilized in analysis and surface treatment recommendations for each street section; however, the PCI values shall be utilized for planning purposes in determining the surface treatment types and are not intended to replace sound engineering judgment. In general, the City's strategies involve the utilization of surface seals, such as crack sealing or slurry sealing for preventive maintenance and rehabilitation (M&R) of streets in "Good" condition and major M&R plans typically consist of overlays, such as thin overlays, for "Fair" condition streets; resurfacing, such as structural overlays or cold-in-place recycling (CIR), for "Poor" condition streets; and reconstruction, such as cement-treated base (CTB) or full depth reconstruction (FDR), for "Very Poor" condition streets.

A fully-integrated PMP has had a positive effect on improving the City's entire pavement network by developing efficient M&R strategies and analyzing the effect of various funding alternatives on the pavement conditions. The strategies include forecasting optimal time for M&R needs, providing cost-effective alternatives for halting the deterioration of existing pavement, improving the overall condition of the entire pavement network, and reducing the backlog of M&R work over the next seven years. To carry forward one of the City's main objectives in providing a safe, reliable, efficient, and comfortable driving environment, this PMP report analyzes various M&R strategies, the effect of the City's existing Capital Improvement Program (CIP) funding on the street pavement system, and projected funding to both maintain and improve existing PCI_{aw} over a seven-year plan.

With existing funding of approximately \$59.3 million for the entire pavement network over the seven-year period from Fiscal Year (FY) 2018/19 through FY 2024/25, the entire pavement network existing PCI_{aw} of 78 is projected to decrease by 10 percent to 70 at the end of the seven-year cycle under existing funding levels. Individually, the arterial and local networks are projected to experience a similar decrease in existing PCI_{aw} , 15 percent and 10 percent, respectively. Furthermore, the backlog for the entire pavement network is projected to increase by 89 percent from \$146.4 million in the first year to \$276.4 million in the seventh year.

If the existing PCI_{aw} of 78 were to be maintained at the end of the seven-year cycle, a total of \$103.2 million in additional funds calculated at about \$14.7 million annually would be required; thus providing for a total alternative funding level of just over \$162.5 million through FY 2024/25. The additional funding would be applied to both the arterial and local networks at 46.7 percent (\$48.2 million) and 53.3 percent (\$55 million), respectively. Furthermore, with this additional funding, the backlog for the entire pavement network is projected to diminish by 3 percent from \$146.4 million in the first year to \$141.8 million in the seventh year.

If the existing PCI_{aw} were to be improved by 1 point to 79 at the end of the seven-year cycle, a total of \$120.6 million in additional funds calculated at about \$17.2 million annually would be required; thus providing for a total alternative funding level of over \$179.9 million through FY 2024/25. The additional funding would be applied to both the arterial and local networks at 46.4 percent (\$55.9 million) and 53.6 percent (\$64.7 million), respectively. Furthermore, with this additional funding, the backlog for the entire pavement network is projected to diminish by 18 percent from \$146.4 million currently to \$119.9 million in the seventh year.

Overall, the conclusion drawn from this PMP report is that the backlog for the entire pavement network is evenly distributed across both the arterial and the local network. Additionally, existing funding levels in the City CIP will not keep pace with rehabilitation needs over the next seven years. Since preserving street condition and performance should be a priority to provide motorists with safety assurances, the City's goal over the next seven years is to acquire sufficient pavement M&R funding to sustain the entire street pavement network at "Good" condition or better. By achieving this goal, the City will remain eligible for the reduced local match requirements for the renewed Measure M2 Competitive grant until FY 2024/25.

Table E-1: Funding Alternatives Summary

	Existing Funding			Alternative Funding (Maintain Existing PCI)			Alternative Funding (Improve Projected PCI)		
	Entire Pavement Network	Arterial Network	Local Network	Entire Pavement Network	Arterial Network	Local Network	Entire Pavement Network	Arterial Network	Local Network
2018 PCI _{law} without Existing Funding ¹	78	73	81	78	73	81	78	73	81
2025 PCI _{law} with Existing Funding ²	70	63	73						
2025 PCI _{law} with Alternative Funding ³				78	73	81	79	74	83
2018 (Current) Backlog ⁴	\$146,424	\$88,664	\$57,760	\$146,424	\$88,664	\$57,760	\$146,424	\$88,664	\$57,760
FY 2024/25 Backlog ⁴	\$276,418	\$160,840	\$115,578	\$141,773	\$91,726	\$50,046	\$119,862	\$80,171	\$39,691
7-yr Preventive M&R Existing Funding ⁵	\$25,556	\$13,867	\$11,689	\$25,556	\$13,867	\$11,689	\$25,556	\$13,867	\$11,689
7-yr Major M&R Existing Funding ⁶	\$33,709	\$26,123	\$7,586	\$33,709	\$26,123	\$7,586	\$33,709	\$26,123	\$7,586

7-yr M&R Additional Funding ⁸				\$103,221	\$48,172	\$55,049	\$120,597	\$55,890	\$64,707
7-yr Total Alternative Funding ⁹				\$162,486	\$88,162	\$74,324	\$179,862	\$95,880	\$83,982

Note: Cost figures are rounded to nearest \$1,000.

- 2018 PCI w/o Existing Funding: PCI yielded as a result of M&R work (existing PCI).
- 2025 PCI w/ Existing Funding: PCI yielded at the end of the 7-year plan as a result of M&R work using existing funding.
- 2025 PCI w/ Alternative Funding: PCI yielded at the end of the 7-year plan as a result of M&R work using alternative (existing plus additional needed) funding.
- Backlog: Total estimated M&R work left unfunded during the listed fiscal year.
- 7-yr Preventive M&R Existing Funding: Existing funding for preventive M&R work from FY 2018/19 to FY 2024/25.
- 7-yr Major M&R Existing Funding: Existing funding for major M&R work from FY 2018/19 to FY 2024/25.
- 7-yr Total Existing Funding: Sum of existing funding from FY 2018/19 to FY 2024/25.
- 7-yr M&R Additional Funding: Additional funding needed for M&R work to reach the listed goal from FY 2018/19 to FY 2024/25.
- 7-yr Total Alternative Funding: Sum of existing & additional funding needed required to reach the listed goal from FY 2018/19 to FY 2024/25.

1.0 INTRODUCTION

Since public streets are utilized for moving people and freight and they are vital to the City of Santa Ana (City) economy, preserving their condition and performance should be a priority. The City Public Works Agency has developed the Pavement Management Program (PMP) to monitor and maintain the City street system over the past ten years utilizing MicroPaver and StreetSaver and geographic information system (GIS). The City's PMP has been developed to assist City personnel generate a solid and reliable Capital Improvement Program (CIP) based on the Pavement Condition Index (PCI) of the streets to sustain a desirable level of pavement performance on a network scale. The PMP's ultimate goal is to effectively strategize short and long-term usages of current and future limited funding to restore and maintain the entire pavement network at "Good" condition or better. Additionally, MicroPaver and StreetSaver have been selected as the pavement management software to be utilized by the Orange County Transportation Authority (OCTA) and all member agencies in Orange County in 2008; therefore, with the City of Santa Ana's continuing effort to maintain its streets and comply with the OCTA's requirements. The City's PMP is in compliance. Prior to this update, the City of Santa Ana migrated its pavement database from MicroPaver to StreetSaver. StreetSaver is a program developed by the Bay and it is the most widely used pavement management system in California. The transition was completed in 2017.

The purpose of the PMP is to:

- Provide an accurate current inventory and pavement conditions of all public roadways;
- Predict future pavement condition with and without work;
- Develop a roadway maintenance program;
- Prioritize and recommend the most cost-effective roadway repairs;
- Implement a 7-year roadway maintenance and rehabilitation (M&R) program;
- Maximize the return from available funding for street pavement.

Pavement is a dynamic structure where deterioration is constantly occurring. Therefore, as part of the development of the PMP, a survey of the City street pavement condition must be conducted on a regular basis to identify the type of severity and quantity of pavement distresses (refer to Section 2.0 Methodology and Appendix IV: Quality Assurance/Quality Control Plan). The pavement management database needs to be updated frequently to reflect the changes in pavement conditions and pavement maintenance histories. Upon completion of the survey and database updates, StreetSaver generates a new PCI value, which assists in the selection of the most cost-effective roadway M&R strategy. The PCI value, which was developed by US Army Construction Engineering Research Laboratory and adopted as standard procedure by the American Society of Testing Materials (ASTM) and the American Association of State Highway and Transportation Officials, has been utilized by numerous municipalities nationwide.

2.0 METHODOLOGY

2.1 INVENTORY

All streets within the City are categorized as either arterial or local streets and are grouped as such into their respective networks; collectively they comprise the entire pavement network. Within each network, the streets are ranked based on their functional classifications (refer to Section 3.0 Pavement Network) and are assigned a letter that corresponds with the rank. In the case of the arterial network, the letter 'B' is assigned to major arterial streets, the letter 'P' is assigned to primary arterial streets, the letter 'S' is assigned to secondary arterial streets. These streets are considered "Arterial" functional classification within StreetSaver. The letter 'C' is assigned to collector arterial streets which is considered "Collector" functional classification in StreetSaver. In the case of the local network, the letters 'E' and 'I' are assigned to residential and non-residential streets, respectively, both of which fall within "Residential/Local" functional classification umbrella in StreetSaver. StreetSaver functional classes follow the guideline as shown in the Federal Highway Administration's (FHWA) "Functional Classification Concepts, Criteria and Procedures" 2013 edition.

Each street, or branch, is divided into segments, or sections, at intersecting streets and railroads. For example, Main Street from First Street to Second Street and Grand Avenue from Railroad to Chestnut Avenue. Additionally, a section break is introduced where a change in pavement surface is encountered mid-block. For example, if the pavement surface were to change from Asphalt Concrete (AC) to Portland Cement Concrete (PCC) at any point along Main Street from First Street to Second Street, then the resulting sections would be Main Street from First Street to AC-PCC Transition and Main Street from AC-PCC Transition to Second Street; where one section has an AC surface and the other has a PCC surface.

In an effort to help identify and sort the streets efficiently, identifying numbers are assigned to each branch and section. A Branch ID is a six digit number assigned to each branch and is numbered increasingly with numbered streets listed first followed by the remainder of the streets listed in alphabetical order. A Section ID is a four digit number assigned to each section and is numbered increasingly based on geography from west to east and from south to north. For example, the westernmost or southernmost section of a branch would have a Section ID with the lowest number and the easternmost or northernmost section of a branch would have a Section ID with the highest number. Furthermore, the four-digit Section ID number may be followed by a letter such as N, S, E, or W that denotes the direction of travel (north, south, east, and west, respectively) along a street. This letter is used to differentiate between the two halves of a street when it is divided as such. For example, Section ID 1100N and Section ID 1100S would denote the northbound and southbound sides of a section, respectively.

Additionally, other sort features are available to assist in further grouping segments with similar characteristics. For example, to identify streets within pre-defined geographical areas, each section is labeled with a number that corresponds to either a neighborhood or a non-neighborhood area. A neighborhood area, which is typically comprised of churches, schools, and residential properties, is defined as the boundary established through a collaboration of the

City's Community Development Agency (CDA) and local residents based on both geographic and social components. Currently, there are 64 neighborhoods established in the City, which meet with CDA staff regularly to develop strategies to shape it for the better and sustain it for the long term. A non-neighborhood area refers to the zone located outside of the established neighborhood boundaries comprising of mostly commercial and industrial uses.

2.2 PLANNING

Preparation prior to performing pavement surveys involves three major components: inspector training, survey type selection, and identifying sample units.

- **Inspector Training** - In order to be familiar with the inspection guidelines, inspectors are prompted to read the Asphalt & Concrete Distress Manuals (ASTM D6433-16), complete the web-based Pavement Management software training and learn the data input application for the StreetSaver program prior to inspecting. Additionally, the inspection routes are planned in a time-efficient manner to efficiently capture the pavement data.
- **Survey Types** - There are two types of surveys allowable: "windshield" and "walking" surveys. A windshield survey consists of examining the pavement from a vehicle moving at no more than 10 miles per hour (MPH), while a walking survey allows an inspector to examine from the pavement surface itself. Although, for safety reasons, walking surveys on arterial roadways may be performed from a safe place adjacent to the pavement such as a sidewalk, center median, or shoulder.
- **Sample Units** - Random areas, known as sample units, within a street section are inspected as a representative of the whole segment. A sample unit for an asphalt street section contains a total area of 2500 square feet (SF) ± 1000 SF, and a sample unit for a PCC street section contains a total number of 20 slabs ± 8 slabs.

2.3 DATA COLLECTION

The pavement distresses found within a sample unit are identified by type, classified by severity, measured/counted by square feet, lineal feet or each, and recorded as they are encountered in the field. A number of sample units are randomly selected for re-inspection to assure consistent and accurate results among inspectors.

Refer to Appendix IV: Quality Assurance/Quality Control Plan for further details on quality control/quality assurance.

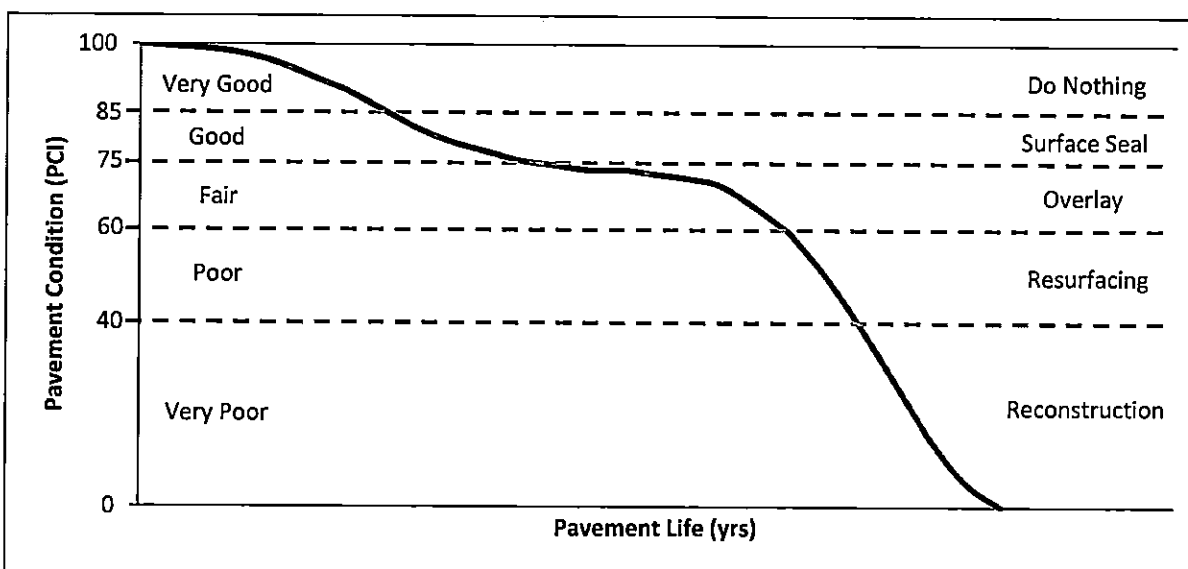

2.4 DATA ENTRY

The collected pavement distress data is input into StreetSaver, creating an inspection record for each sample unit.

2.5 ANALYSIS

Based on the latest inspection data and several other factors, including surface type, functional classifications, last construction date, and PCI, pavement deterioration curves (PDCs) or pavement condition prediction models are generated separately for the local and arterial networks. These curves are imperative for a complete PMP to predict future pavement performance and determine maintenance and rehabilitation (M&R) requirements. Figure 2-1 shows a sample PDC with the appropriate M&R.

Figure 2-1: Sample Pavement Deterioration Curve

To develop an accurate PDC, "suspicious" data / anomalies outside of the maximum and minimum envelopes generated from StreetSaver are filtered out. For example, data with PCI increase significantly with age (recording error) or lack of past inspection data must be removed because pavements are load carrying structures, which degrade over time due to the combined action of environmental and traffic. This data filtering processing is critical because pavements with unusual performance would have substantial impact on the PDC behavior and the pavement life cycle consequently.

The final PDCs illustrate that the rate of deterioration is fairly slow in the early years of the pavement's design life. During the first 65 percent to 75 percent of a pavement's design life, which varies based on functional classifications and surface type, a pavement deteriorates approximately 40 percent of its quality, i.e. from a PCI of 100 ("Very Good" condition) to a PCI of 60 ("Fair" condition). However, the rate of deterioration starts to increase rapidly with age after a pavement reaches this point in its life cycle. Typically, a pavement can deteriorate 40 percent in its quality (PCI quickly drops from 60 ("Fair" condition) to 20 ("Very Poor" condition)) in the next 15 percent to 25 percent of its design life. Although the local and arterial networks have different design life spans, both PDCs share similar characteristics because the pavement will crack and these cracks will propagate out and become severe with continued traffic loadings and weathering without any M&R treatment. Therefore, a PCI of 60 is assigned as the critical

PCI for both the arterial and local networks. The critical PCI is defined as the PCI value after which a pavement section is expected to deteriorate rapidly with age or where the rate of PCI loss increases significantly with time.

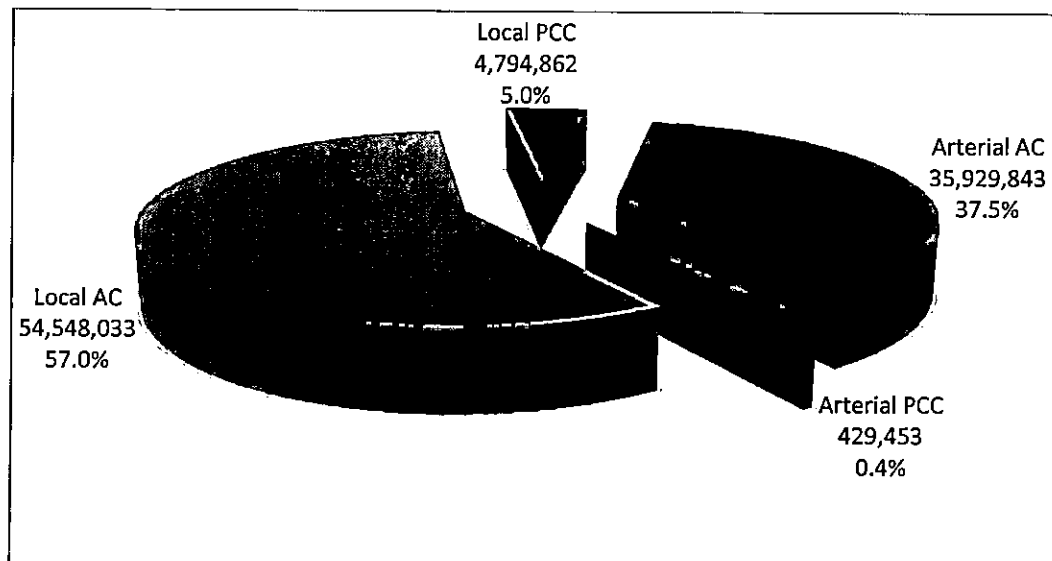

3.0 PAVEMENT NETWORK

Currently, the City's entire street pavement network has approximately 422.8 centerline miles consisting of approximately 95.7 million square feet of paved surfaces. To assist planning maintenance needs, the entire pavement network is organized into two networks (arterial and local) depending on their importance in the whole roadway system. The arterial and local networks include 106.2 centerline miles (25 percent) and 316.6 centerline miles (75 percent), respectively. To be consistent with the City General Plan Circulation Element Master Plan of Streets and Highways and the Orange County Transportation Authority (OCTA) Master Plan of Arterial Highways (MPAH), the streets in each network are ranked based on their functional classes; the arterial network is comprised of Major, Primary, Secondary arterial streets and Collector Streets, and the local network is comprised of Residential and Non-Residential streets. Additionally, these streets are classified by surface types—Asphalt Concrete (AC) or Portland Cement Concrete (PCC); and they are divided into more than 4,300 sections (refer to section 2.0 Methodology) for ease of tracking their pavement conditions, pavement history and M&R requirements. Table 3-1 and Figure 3-1 summarize the current City pavement networks information.

Table 3-1: Current Entire Pavement Network Summary

Network Type	Surface Type	Area (SF)	Centerline Mile
Arterial	AC	35,929,843	104.0
Arterial	PCC	429,453	2.2
Local	AC	54,548,033	292.2
Local	PCC	4,794,862	24.4
Entire Pavement Network		95,702,191	422.8

Figure 3-1: Entire Pavement Network Summary

3.1 FUNCTIONAL CLASSIFICATIONS

One of the critical factors affecting the roadbeds and pavement deterioration rate is the quantity and associated vehicle weight of traffic utilizing the streets. The volume and type of vehicular usage for the abovementioned arterial network's four functional classifications are:

- **Major Arterial** – Generally consists of a six-travel lane, divided roadway connecting various parts within the City of Santa Ana and adjacent cities. A major arterial is designed to accommodate between 30,000 and 50,600 vehicle trips daily. This facility type comprises approximately 58 centerline miles or 55 percent of City arterial network.
- **Primary Arterial** – Generally consists of a four-lane, divided roadway serving as a major access route to regional destinations (such as downtown and similar major focal points within the City). A primary arterial is designed to accommodate between 20,000 and 30,000 vehicle trips daily. This facility type comprises approximately 10 centerline miles or 9 percent of City arterial network.
- **Secondary Arterial** – Generally consists of a four-lane, undivided roadway serving intra-city mobility. A secondary arterial is designed to accommodate between 10,000 and 20,000 vehicle trips daily. This facility type comprises approximately 35 centerline miles or 33percent of City arterial network.
- **Collector Street** – Generally consists of a two-lane, undivided roadway. A collector street is designed to accommodate between 7,500 and 10,000 vehicle trips daily. This facility type comprises approximately 3 centerline miles or 3 percent of City arterial network.

Figure 3-2: Arterial Street

The local network is comprised of two functional classifications as described below:

- **Non-Residential Street** – Generally a low-speed two-lane, undivided roadway with parking allowed on both sides of the street. Businesses are located on both sides of the street. A non-residential street is designed to accommodate less than 6,000 vehicle trips daily. This facility type comprises approximately 32 centerline miles or 10 percent of City local network.
- **Residential Street** – Generally a low-speed and low-volume two-lane, undivided roadway providing access to individual properties in a neighborhood. A residential street is designed to accommodate less than 6,000 vehicle trips daily. This facility type comprises approximately 285 centerline miles or 90 percent of City local network.

Figure 3-3: Local Street

3.3 EXISTING PAVEMENT CONDITION

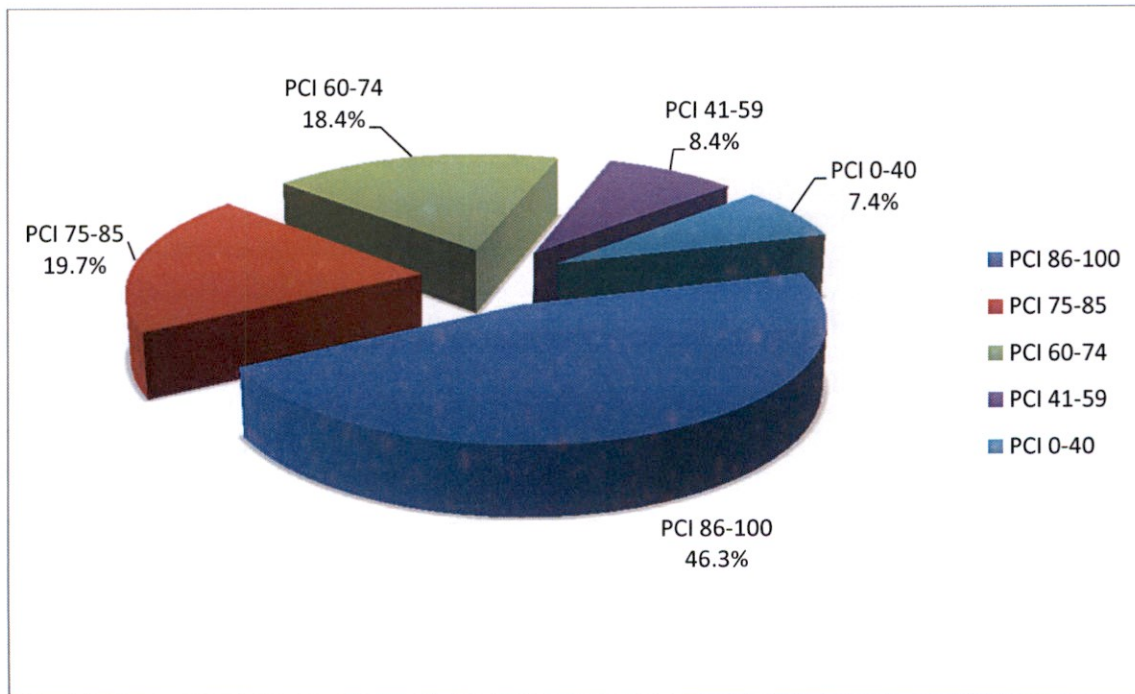

Based on the inspections and data processing procedures mentioned in Section 2.0 Methodology, the majority of the local street's pavements (59.3 percent) currently have a PCI of at least 86 or in "Very Good" condition; this indicates that the City's local network continues to demonstrate high conditional values. However, these results show a decrease in the entire network since the City's prior update in 2016 due to a 13.8 percent decline in the local network (refer to Table 3-3 for PCI distribution in 2016 compared to 2018).

Table 3-3: PCI Distribution Comparison (2016 vs. 2018)

Pavement Quality	PCI	Entire Network		Arterial Network		Local Network	
		2016	2018	2016	2018	2016	2018
Very Good	86-100	61.0%	46.3%	41.6%	25.1%	73.1%	59.3%
Good	75-85	14.8%	19.7%	22.0%	23.6%	10.3%	17.2%
Fair	60-74	12.2%	18.4%	27.7%	30.9%	2.7%	10.7%
Poor	41-59	4.7%	8.4%	7.8%	12.3%	2.7%	6.0%
Very Poor	0-40	7.3%	7.4%	0.9%	8.2%	11.2%	6.8%

With the proper maintenance and rehabilitation application of the local and arterial streets, approximately two-thirds of the entire pavement network is currently in "Very Good" or "Good" condition (approximately 66 percent) with a PCI of at least 75, which is similar to the results from the previous update in 2016. Figure 3-4 summarizes the current PCI distribution for the entire pavement network.

Figure 3-4: Current PCI Distribution (Entire Pavement Network)

3.2 PAVEMENT CONDITION INDEX

The City utilizes PCI output from StreetSaver as the rating mechanism to describe the City street pavement condition. This numerical index ranges from PCI of "0" for a failed and/or badly deteriorated pavement with virtually no remaining life to PCI of "100" for a pavement in perfect condition. A street section with proper engineering design and construction begins its life cycle as a new or recently rehabilitated street with a PCI of "100". As the condition of the street surface begins to deteriorate, the PCI decrease reflects the surface deterioration based on the signs of distress noted during the field surveys (refer to Section 2.0 Methodology and Appendix IV: Quality Assurance/Quality Control Plan). Although the surface treatment recommendation for each street section utilizes the PCI value as the basis, the PCI values shall be used for planning purposes only and are not intended to replace sound engineering judgment. An engineering review of the pavement condition shall take place prior to any actual construction work at a particular street section because the review may indicate that a particular pavement section needs attention earlier than the other street sections in its localized area.

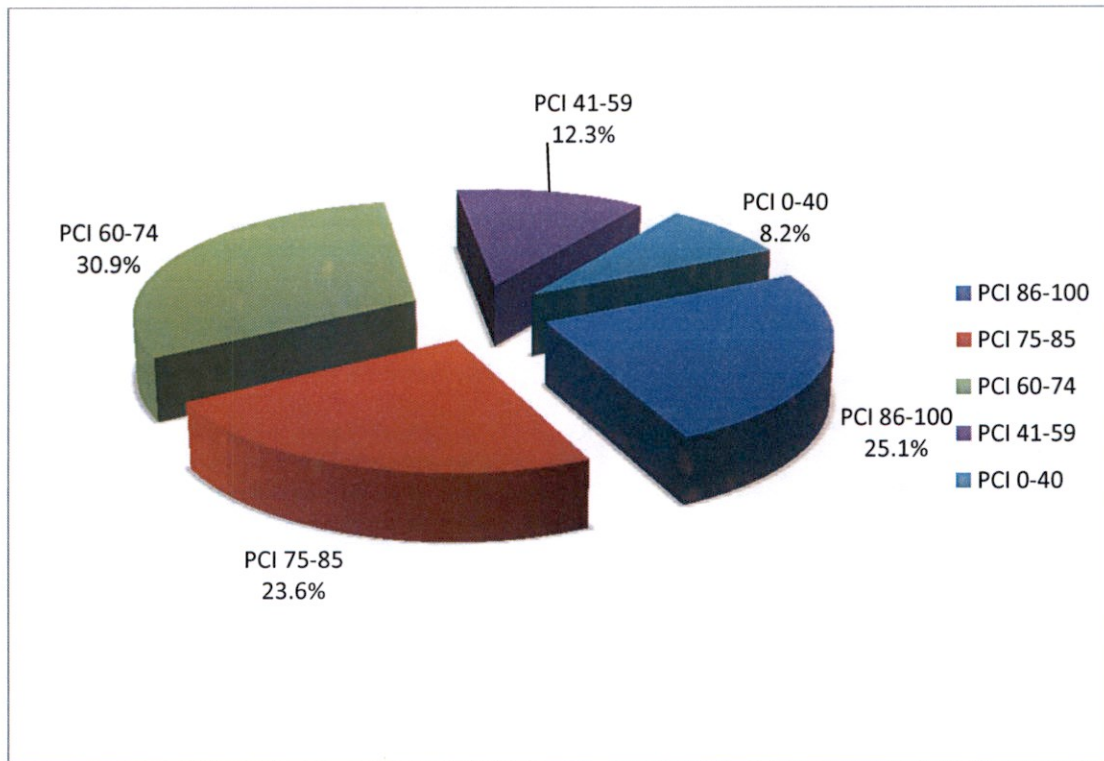

In general for planning and budgeting purposes, the correlation among the PCI, pavement quality and signs of distresses are summarized in Table 3-2:

Table 3-2: Pavement Condition Index and Treatment Type

Pavement Quality	PCI	Pavement Description
Very Good	86-100	The pavement is new or almost new with very little or no roughness and surface distress (except utility patches if any), including minimal hairline cracks and/or weathering. The pavement structure is sound and no oxidation occurs.
Good	75-85	The pavement has minor roughness and little to slight surface distresses (except utility patches if any), including slight cracking, slight to moderate weathering. The pavement structure is sound and some oxidation may occurs.
Fair	60-74	The pavement may have noticeable roughness and slight to moderate distresses are surfacing, including severe weathering, non-load-related cracking, depressions, and material loss. The pavement structure is becoming deficient (minimal base failure).
Poor	41-59	The pavement has noticeable roughness (significant surface distortion) and moderate to severe surface distresses, including severe weathering, load-related cracking (such as alligator cracking), depressions, and material loss. The pavement structure is deficient (up to one-third base failure).
Very Poor	0-40	The pavement has severe surface distresses, including large quantities of distortion and major and unsafe cracking (alligator cracking). The pavement structure is inadequate (over one-third failure).

As shown in Table 3-3, the majority of arterial streets' pavements are currently either in "Fair" (30.9 percent), "Good" (23.6 percent), or "Very Good" (25.1 percent) conditions. Figure 3-5 shows the current PCI distribution of the arterial network.

Figure 3-5: Current PCI Distribution (Arterial Network)

The improvement in the condition of the local pavement network in recent years resulted largely from the Residential Street Repair Program (RSRP), which is a comprehensive residential street improvement plan that commenced in 2008. A dedicated team of staff and experts evaluated the entire local pavement and incorporated a “Best Streets First” approach for the RSRP, whereby the streets needing the least amount of work are repaired first to prevent further deterioration and the streets categorized in “Very Poor” condition will be repaired last. As of December 2015, 206 centerline miles of local asphalt and concrete residential streets have been repaired through the RSRP. The goal going forward will be utilizing available funding to repair residential concrete streets and establishing preventative maintenance program. Figure 3-6 shows the current PCI distribution of the local network.

Figure 3-6: Current PCI Distribution (Local Network)

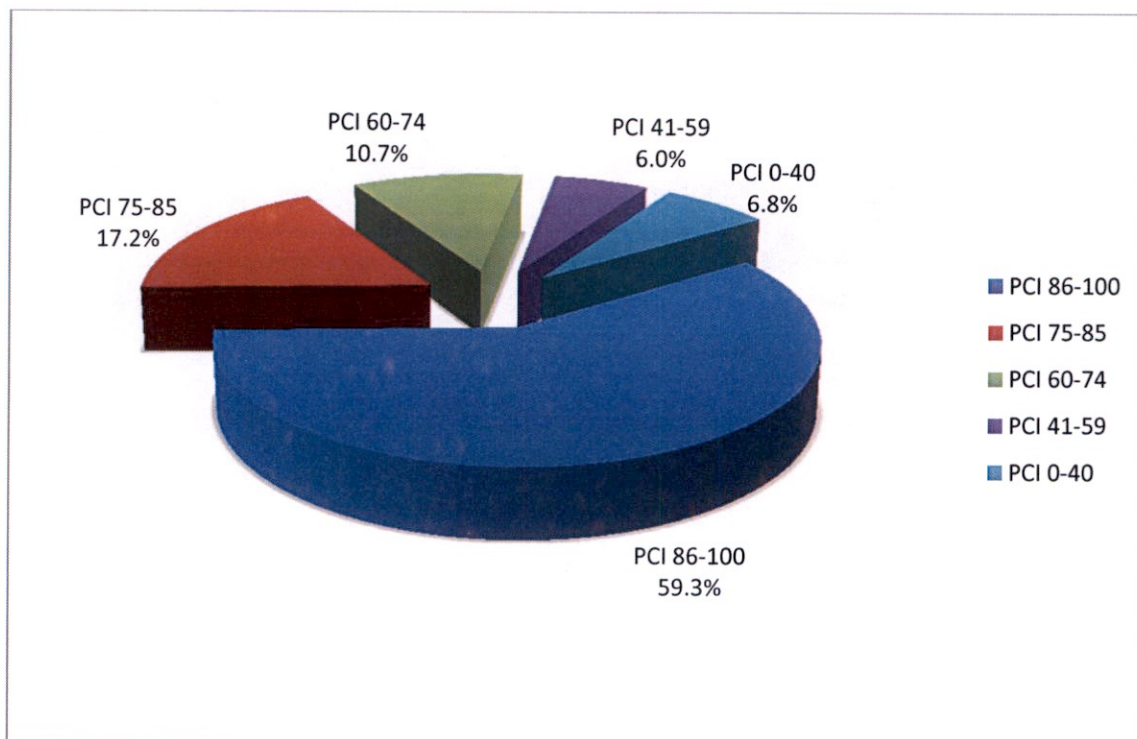

Table 3-4 shows the breakdown of PCI distribution of the entire pavement network, and the arterial and local pavement networks individually, based on area and centerline mileage.

Table 3-4: PCI Distribution

Pavement Quality	PCI	Entire Network		Arterial Network		Local Network	
		MILE	AREA (SF)	MILE	AREA (SF)	MILE	AREA (SF)
Very Good	86-100	217.5	44,300,945	25.9	9,122,037	191.6	35,178,908
Good	75-85	78.5	18,800,389	24.3	8,586,822	54.2	10,213,567
Fair	60-74	67.3	17,562,948	33.9	11,221,247	33.4	6,341,701
Poor	41-59	29.0	8,000,870	11.8	4,456,626	17.2	3,544,244
Very Poor	0-40	30.5	7,037,039	10.3	2,972,564	20.2	4,064,475
		422.8	95,702,191	106.2	36,359,296	316.6	59,342,895

The pavement condition is generally measured by a weighted index (typically by area), referred to as Average Area-Weighted Pavement Condition Index (PCI_{aw}), which is determined as follows:

$$PCI_{aw} = \frac{\sum_{i=1}^n (PCI_i \times A_i)}{\sum_{i=1}^n A_i}$$

Where,

PCI_{aw} = Average area-weighted PCI

PCI_i = PCI of pavement section number i

A_i = Area of section number i

n = Total number of pavement sections

Based on the formula above, the City's current entire pavement network is in "Good" condition with a PCI_{aw} of 78.

4.0 MAINTENANCE AND REHABILITATION STRATEGIES

With 422.8 centerline miles and 4,300 street sections, the City develops a comprehensive, fully-integrated PMP utilizing the inventory data along with the inspection information, M&R options and their associated costs, and predictions about future pavement condition from StreetSaver to determine optimal time for maintenance and rehabilitation needs. Due to limited available fiscal resources, the City needs to perform cost-effective M&R strategies to maintain the pavement networks. Additionally, pavement preservation, which is an important aspect of the PMP considering the limited funding, will be included in the overall decision-making process.

4.1 TREATMENT TYPES AND ASSOCIATED COSTS

The pavement preservation and M&R considerations utilized by the City are categorized into localized, global and major M&R. Localized M&R can be applied as a stop-gap measure or a preventive measure, including routine maintenance such as crack-filling and pothole repairs. Global M&R, which is cost effective when applied as a preventive measure, are methods applied to the entire pavement sections to slow the rate of deterioration and improve current PCI, including applying slurry seal to the existing pavement surface. Major M&R, which is often economically applicable to deteriorated pavements, pavements deteriorating at a rapid rate, and pavements subjected to a change in traffic loading, refer to methods correcting or improving structural and functional requirements, including cold-milling and overlay, cold-in-place recycling, cement treated base, and/or full depth reconstruction. The City currently utilizes the following M&R treatment methods:

- **Crack Seal** – Crack Seal is applicable for newer pavements with cracks beginning to form. Since water is the most destructive element to a roadway pavement, this treatment utilizes asphalt materials bonding to the crack walls to restrict water penetration into the underlying base and sub-base layers to reduce further pavement deterioration. This preventive M&R treatment, which will extend the pavement life by three to five years, saves money by delaying the expense of major reconstructive pavement work.
- **Slurry Seal** – Slurry Seal, which applies to pavement with minimal surface distress, such as minor cracks, provides a new wearing surface to extend the pavement life. This treatment is a mix blend of high quality crushed aggregates (sand-like), asphalt emulsion, water and mineral fillers, spreading over the entire pavement surface. The layer of slurry seal (ranging from 1/8" to 3/8" thick) prevents further oxidization and water from further deteriorating the asphalt concrete surface and subgrade, corrects raveling, and improves skid resistance.
- **Thin Overlay** – Thin Overlay is a maintenance overlay applicable to pavement with moderate cracking where preventive M&R is no longer effective. This treatment involves partially milling or grinding the edge of shoulder (typically 6 feet), sealing the cracks to retard reflective cracking, and placing a thin layer of hot-mixed asphalt concrete (up to two inches for streets in both arterial and local networks) over the existing pavement

surface. The thin layer of AC improves the skid resistance and roadway's performance, and corrects the crown and drainage features.

- **Structural Overlay** – Structural Overlays, which applies to moderate to severe pavement cracking with little or no deficiency in the foundation layers, entails cold-milling / grinding the surface to a depth of up to three inches for arterial streets and two inches for local streets, removing localized failed areas, and placing a thick layer of hot-mixed AC (typically four to five inches for arterial streets and three to four inches for local streets). The new AC pavement section smooth the ride performance, improves skid resistance, correct the crown and drainage features, increases pavement structural capacity.
- **Cold-In-Place Recycling (CIR)** – CIR, which applies to moderate to severe pavement cracking with little or no deficiency in the pavement structure, is a process rehabilitating pavement by recycling it in place. The top layer of pavement is removed with a milling (grinding) machine to a specified depth (typically three to four inches). The removed material is then crushed, sorted and mixed with a specially formulated asphalt emulsion. This emulsion mixes with the milled pavement and acts as a binder to form the new CIR pavement. This new mixture is placed on the roadway by a StreetSaver and compacted as a new and more durable asphalt base course. Finally, a thin overlay of conventional asphalt pavement is placed over the CIR to seal it and provide a new wear to improve ride performance and drainage features and increase pavement structural capacity.
- **Cement-Treated Base (CTB)** – CTB is applicable when the distress evidence at the surface indicates failure in the pavement structure or subgrade (the roadway completely failed with crumbling surface pavement), which is not correctable by less extensive construction. Due to its long curing time, this treatment method typically should be applied to low-moderate traffic areas and/or moderate traffic areas with more than one lane per direction with a low volume of large vehicles. CTB involves grinding the existing roadway surface and base into pieces to a prescribed depth (typically 14 to 20 inches for arterial streets and 8 to 11 inches for local streets), which are mixed with cement and water to be used as a base course. A thin overlay of conventional asphalt pavement is then placed over the CTB base to provide a new wear for improving ride performance and drainage features and increase pavement structural capacity.
- **Full Depth Reconstruction (FDR)** – FDR is applicable when the distress evidence at the surface indicates failure in the pavement structure or subgrade (the roadway completely failed with crumbling surface pavement), which is not correctable by less extensive construction. This treatment involves removal of existing layers of asphalt AC, PCC, and/or base to a prescribed depth recommended by geotechnical engineering pavement analysis and placement of conventional flexible pavement section. In general, local residential and non-residential streets are removed to depths of six inches and eight inches, respectively; a depth of 10 inches are removed on secondary arterial and collector streets; a depth of 12 inches are removed on primary arterial streets; and a depth of 16 inches are removed on major arterial streets. The actual depth depends on anticipated traffic loading, soil conditions, and roadway functional classifications. This treatment is by far the most expensive form of M&R strategies to increase pavement structural capacity.

Table 4-1: Cost by Condition (Arterial Network)

Condition (PCI)	Functional Classification	Surface	Cost (\$/SF)
75 - 85	Secondary / Collector	AC	\$1.45
	Primary		
	Major		
60 - 74	Secondary / Collector	AC	\$3.72
	Primary		
	Major		
41 - 59	Secondary / Collector	AC	\$5.56
	Primary	AC	\$5.78
	Major	AC	\$5.78
	Secondary / Collector	PCC	\$3.89
	Primary		
0 - 40	Major	PCC	\$12.22
	Secondary / Collector		
	Primary	AC	\$12.22
	Major	AC	\$12.22
	Secondary / Collector	AC	\$8.89

Table 4-2: Cost by Condition (Local Network)

Condition (PCI)	Functional Classification	Surface	Cost (\$/SF)
75 - 85	Residential	AC	\$0.83
	Non-Residential		
60 - 74	Residential	AC	\$3.00
	Non-Residential		
41 - 59	Residential	AC	\$3.72
	Non-Residential	PCC	\$2.78
	Residential		
0 - 40	Residential	AC	\$5.00
	Non-Residential	PCC	\$6.00
	Residential		

The costs in Table 4-2 show average unit costs for Arterial, Collector, and Residential. Actual unit costs for each sub category may vary.

It is imperative for the City to receive the proper amount and type of funding to perform the M&R strategies as a plan to preserve the roadway pavement system in good condition. The plan is to apply a slurry seal coat to new or recently rehabilitated streets at regular intervals, usually seven to ten years. After a couple slurry seal coats, maintenance (thin) overlay or structural overlay shall be utilized to address structural issues. Every street will fail eventually or reach a point

where it is more cost-effective to reconstruct than to repair. The roadway functional classification (refer to Section 3.0 Pavement Network) and the original design life of a particular street section will determine the intervals and treatment types. Additionally, streets with higher speeds, traffic volumes, and/or loads, will demand a larger pavement section.

To account for the differences in pavement section across the spectrum of streets within the entire pavement network, the streets are grouped into M&R families according to their functional classification and/or surface type and a cost by condition is applied. The cost by condition for the arterial and local networks is shown in Table 4-1 and Table 4-2, respectively. These unit costs per SF include the soft costs of design, inspection, and construction engineering and are compiled utilizing current projects as a basis for costs.

As the pavement ages, the PMP is designed to predict the roadway pavement's PCI based on the deterioration curves (refer to Section 2.0 Methodology). Additionally, the PMP, which is a tool to assist the City in making decisions when planning pavement M&R, involves scheduling pavement maintenance and rehabilitation before pavements deteriorate to a condition where reconstruction is the only solution. Based on Figure 2-1 in Section 2.0 Methodology showing how pavement generally deteriorates and the relative M&R cost (refer to Table 4-1 and Table 4-2) at various times throughout the pavement life, the critical PCI is established at 60. The critical PCI is defined as the PCI value after which the pavement section is expected to deteriorate rapidly with age, or the rate of PCI loss increases significantly with time, and the unit cost of repair greatly increases; therefore, the threshold for M&R decisions are considered at the critical PCI value since the cost of maintaining the pavement above the critical PCI value before the deterioration occurs is much less compared to maintaining pavements after substantial deterioration has occurred. Planned M&R strategies, essentially preventing pavements from reaching deteriorated conditions, helps the City stretch and maximize the use of City budgets and prolong the life of the pavements. StreetSaver utilizes the inventory database combined with the inspection information, M&R options along with their associated costs, and the deterioration curves predicting future pavement condition to calculate the chosen budget activity to reflect the best pavement management practices and costs.

The City's PMP goal is to maintain a pavement system network with an optimal PCI of 75 ("Good" Condition) or better. The City's pavement system currently has 65.9 percent of the pavement sections in "Good" or "Very Good" condition (refer to Section 3.0 Pavement Network). The PMP will recommend priority list of maintenance treatments annually to bring all City streets to at least "Good" condition. The preventive M&R treatments, which are inexpensive treatments to extend pavement life cycle, have minimal costs since they are applied prior to pavement deterioration to "Poor" and "Very Poor" conditions.

4.2 FUNDING

The City has estimated total funding amounts of \$40 million and \$19.3 million for the pavement expenditures – such as maintenance and rehabilitation treatments as well as street widening, etc. - of the arterial and local networks, respectively, for the next seven years (refer to City CIP on a separate document for further details). Generally, the future revenues for City street preventive and major M&R programs are from the following funding sources:

- **Community Development Block Grant (CDBG)** – The Housing and Community Development Act of 1974 returns income tax funds to cities and counties to develop viable urban communities, primarily for the benefit of low and moderate income people. This U.S. Department of Housing and Urban Development program gives priority to activities that help to eliminate blight, with emphasis on residential areas. CDBG projects are carried out by several operating departments with the City and by sub-agents. Public hearings are held to plan projects for each fiscal year. The selected projects are recommended by citizens, commissioners, and staff.
- **Gas Tax** – Gas Tax funds are derived from the Motor Vehicle Fuel Tax (or Highway Users Tax Account (HUTA)). Motorists pay a tax for fuel consumption. It is apportioned to cities according to population and can only be utilized in the maintenance and construction of the street system.
- **Local Street Bond Fund** – In 2007, the City issued a \$60 million bond as a certificate of participation (COP) against Gas Tax revenue to create the Residential Street Repair Program to repair and rehabilitate neighborhood streets Citywide.
- **Measure M2** – On November 7, 2006, voters approved the renewal of the Measure M half-cent sales tax (Measure M2), extending the program over a 30-year period beginning in 2011. In addition to the original three program components, this generation of the Measure M Transportation Plan expands the program to include Environmental Cleanup and Taxpayer Safeguards and Audits. To receive revenues from the one-half-cent sales tax, cities and the County of Orange must coordinate their land use and transportation decisions, establish cooperative transportation planning programs with neighboring jurisdictions, develop Growth Management programs, and guarantee that transportation funds are used for transportation purposes only.
- **Measure M2 – Competitive** – The competitive portion of the Measure M2 consists of the following programs: Regional Capacity Program (RCP), Regional Traffic Signal Synchronization Program (TSSP), and several transit programs.
- **Measure M2 – Fairshare** – This local fair share program returns a portion of the Measure M2 Streets and Roads revenues to the cities and the County of Orange once specific program requirements are met. Disbursement amounts are based on a formula that accounts for population, street mileage, and sales tax collected.

4.3 BUDGET ALTERNATIVES

Having determined the needs of the City local and arterial networks and the City fiscal-year budget for the next seven years, the City utilizes StreetSaver to evaluate impacts of various budget alternatives – existing budget in City CIP, budget to maintain the current PCI_{aw} over a seven year plan, and budget to improve the current PCI_{aw} by one point or better over a seven-year plan. StreetSaver has the capability of forecasting the effects of different budget alternatives on PCI and deferred maintenance (backlog). By examining the effects of these indicators, these “what-if” analyses clearly identify the advantages and disadvantages of different funding levels and preventive and major M&R strategies.

The following guide is provided for interpreting the individual output in Budget Analysis tables below.

- **PCI w/o Existing Funding** – PCI yielded as a result of no preventive or major M&R work during the listed fiscal year. This value is provided for comparison purposes and is intended to be used as the baseline PCI.
- **PCI w/ Existing Funding** – PCI yielded as a result of preventive and major M&R work with existing funding during the listed fiscal year.
- **PCI w/ Alternative Funding** – PCI yielded as a result of preventive and major M&R work with existing plus additional funding during the listed fiscal year.
- **Preventive M&R Existing Funding** – Existing funding for preventive M&R work during the listed fiscal year.
- **Major M&R Existing Funding** – Existing funding for major M&R work during the listed fiscal year.
- **Major M&R Additional Funding** – Additional funding for major M&R work required to reach the listed goal during the listed fiscal year.
- **Total Existing Funding** – Sum of existing funding during the listed fiscal year.
- **Total Alternative Funding** – Sum of existing funding plus additional funding required to reach the listed goal during the listed fiscal year.
- **Backlog** – Total estimated M&R work left unfunded during the listed fiscal year.

4.3.1 EXISTING FUNDING

This alternative represents the impacts of the City's current CIP budget on the entire pavement network, and the arterial and local pavement networks independently, for the next seven years. Currently, there are approximately \$40 million and \$19.3 million for the pavement expenditures in the arterial and local networks, respectively, for the next seven years. The City's main objective is keeping street sections from falling into the reconstruction category ("Very Poor" condition), at which point typically costs three to four times more per SF than resurfacing. Therefore, the selection of streets for M&R treatments during each fiscal year involves StreetSaver output, engineering judgment and experience, and available budget.

With a limited existing budget over the next seven years from FY 2018/19 to FY 2024/25, the entire pavement network will change from "Good" to "Fair" condition by deteriorating from a PCI_{aw} of 78 to a PCI_{aw} of 70. Not only does the pavement condition deteriorate, but the entire pavement network's backlog will increase approximately 89 percent by FY 2024/25 as shown in Table 4-3. This information indicates that the City is facing the challenge of securing adequate, sustainable funding for the M&R program to keep up with the increasing rate of deteriorating streets.

Although the arterial and local networks, independently, will improve the PCI_{aw} by at least one point during each of the next seven FYs with the existing budgeted funding as compared to the baseline alternative (without any funding), the pavement will deteriorate in a similar fashion to the entire pavement network. Furthermore, both the arterial and local networks will change from "Good" to "Fair" condition with the existing funding amount as shown in Table 4-4 and Table 4-5. Additionally, the current level of funding is insufficient to stabilize the backlog since the unfunded deferred M&R projects will increase by 89 percent for the entire pavement network.

Table 4-3: Existing Funding (Entire Pavement Network)

Fiscal Year	PCI _{aw} w/o Existing Funding	PCI _{aw} w/ Existing Funding	Preventive M&R Existing Funding	Major M&R Existing Funding	Total Existing Funding	Backlog
2018/19	77	79	\$3,334	\$7,949	\$11,283	\$146,424
2019/20	74	77	\$3,386	\$10,088	\$13,474	\$163,842
2020/21	72	75	\$3,471	\$1,559	\$5,031	\$182,013
2021/22	80	74	\$3,707	\$1,593	\$5,300	\$203,982
2022/23	68	72	\$3,661	\$9,226	\$12,886	\$229,401
2023/24	66	71	\$4,005	\$1,662	\$5,667	\$255,689
2024/25	65	70	\$3,992	\$1,632	\$5,624	\$276,418
TOTAL			\$25,556	\$33,709	\$59,265	

Note: Cost figures are rounded to nearest \$1,000.

Table 4-4: Existing Funding (Arterial Network)

Fiscal Year	PCI _{aw} w/o Existing Funding	PCI _{aw} w/ Existing Funding	Preventive M&R Existing Funding	Major M&R Existing Funding	Total Existing Funding
2018/19	71	74	\$1,363	\$7,145	\$8,508
2019/20	68	73	\$1,753	\$8,971	\$10,724
2020/21	66	70	\$1,831	\$450	\$2,281
2021/22	64	69	\$2,121	\$429	\$2,550
2022/23	61	67	\$2,079	\$8,057	\$10,136
2023/24	59	65	\$2,385	\$532	\$2,917
2024/25	56	63	\$2,335	\$539	\$2,874
TOTAL			\$13,867	\$26,123	\$39,990

Note: Cost figures are rounded to nearest \$1,000.

Table 4-5: Existing Funding (Local Network)

Fiscal Year	PCI _{aw} w/o Existing Funding	PCI _{aw} w/ Existing Funding	Preventive M&R Existing Funding	Major M&R Existing Funding	Total Existing Funding
2018/19	80	81	\$1,971	\$804	\$2,775
2019/20	78	79	\$1,633	\$1,117	\$2,750
2020/21	76	78	\$1,641	\$1,109	\$2,750
2021/22	74	77	\$1,586	\$1,164	\$2,750
2022/23	73	76	\$1,581	\$1,169	\$2,750
2023/24	71	75	\$1,620	\$1,130	\$2,750
2024/25	70	73	\$1,657	\$1,093	\$2,750
TOTAL			\$11,689	\$7,586	\$19,275

Note: Cost figures are rounded to nearest \$1,000.

4.3.2 ALTERNATIVE FUNDING LEVELS REQUIRED TO MAINTAIN EXISTING PCI

With existing funding of \$59.3 million for the entire pavement network over the seven-year period from FY 2018/19 through FY 2024/25, additional funding is required to maintain the existing PCI_{aw} of 78. This alternative provides an available prioritized list of streets with recommended M&R treatment to allow the City to hand select if unforeseen funds become available at some point in the future. As illustrated in Table 4-6, a total of \$103.2 million in additional funds calculated at about \$14.7 million annually would be needed; thus providing for a total alternative funding level of just over \$162.5 million over the seven-year period. Furthermore, with this additional funding, the current backlog of \$146.4 million would be reduced by about 3 percent to \$141.8 million for FY 2024/25.

Demonstrated in Table 4-7 and Table 4-8, 46.7 percent (\$48.2 million) of the additional funding (\$103.2 million) would be applied to the arterial network and 53.3 percent (\$55 million) would be applied to the local network. As a result, the existing PCI_{aw} would be maintained at 78.

Table 4-6: Alternative Funding Levels Required To Maintain Existing PCI (Entire Pavement Network)

Fiscal Year	PCI _{aw} w/o Existing Funding	PCI _{aw} w/ Alternative Funding	Preventive M&R Existing Funding	Major M&R Existing Funding	Additional Funding	Total Alternative Funding	Backlog
2018/19	77	81	\$3,334	\$7,949	\$19,717	\$31,000	\$146,424
2019/20	74	80	\$3,386	\$10,088	\$14,230	\$27,704	\$129,513
2020/21	72	79	\$3,471	\$1,559	\$12,612	\$17,643	\$133,981

4.3.3 ALTERNATIVE FUNDING LEVELS REQUIRED TO IMPROVE PCI

With existing funding of approximately \$59.3 million for the entire pavement network over the seven-year period from FY 2018/19 through FY 2024/25, additional funding is required to improve the existing PCI_{aw} for FY 2018/19 of 78 by one point or better. As illustrated in Table 4-9, a total of \$120.6 million in additional funds calculated at about \$17.2 million annually would be needed; thus providing for a total alternative funding level of over \$179.9 million over the seven-year period. Furthermore, with this additional funding, the backlog for FY 2018/19 of \$146.4 million would decrease about 18 percent to \$119.9 million for FY 2024/25.

Demonstrated in Table 4-10 and Table 4-11, 46.4 percent (\$55.9 million) of the additional funding (\$120.6 million) would be applied to the arterial network and 53.6 percent (\$64.7 million) would be applied to the local network. As a result, the existing PCI_{aw} would be improved to 79.

Table 4-9: Alternative Funding Levels Required To Improve PCI (Entire Pavement Network)

Fiscal Year	PCI _{aw} w/o Existing Funding	PCI _{aw} w/ Alternative Funding	Preventive M&R Existing Funding	Major M&R Existing Funding	Additional Funding	Total Alternative Funding	Backlog

Appendix A - Resumes of Field Inspectors

1. Introduction

When performing data collection in any field, the need for quality control is paramount. This need for quality data is essential for accurate planning, analysis and design. NCE's "Quality Assurance Management Plan" (QAMP) affirms that:

"NCE is dedicated to achieving technical and management excellence and to delivering professional engineering and environmental services that meet or exceed our clients' needs. NCE's Quality Assurance/Quality Control (QA/QC) Program is designed to achieve these goals. This QA Management Plan (QAMP) describes NCE's QA Program, which is based on four principles: client satisfaction, employee participation, problem prevention, and continuous quality improvements."

NCE's QAMP establishes minimum quality standards for performance and procedures for assuring that our clients receive quality service. It requires the participation of employees at every level. It encourages Project Managers and technical staff to take pride in their work and responsibility for ensuring that the work is done correctly the first time. The program is designed to reduce the incidence of problems related to quality and results in implementation, where necessary, of corrective actions and modification of work procedures to minimize the incidence of future problems.

NCE has also prepared detailed and specific Quality Control Plans for projects, and the most notable example is for the **Long Term Pavement Performance (LTPP) – Western Regional Support Contract** for the Federal Highway Administration. This is a 150 page document that covers data collection on highways, including deflection, profile, pavement distresses, traffic, maintenance and rehabilitation history, materials testing and sampling as well as a document control.

1.1. Objectives

This document constitutes a formal Quality Control Plan (QCP) for the City of Santa Ana. The focus is on data collection issues as part of the pavement management update.

Specifically, it is intended for the 2017/2018 Pavement Management Update. The focus is on the collection of network-level pavement distress data (defined by NCHRP Synthesis 401 *Quality Management of Pavement Data Collection*, as "Network-level data collection involves collection of large quantities of pavement condition data, which is often converted to individual condition indices or aggregated into composite condition indices.")

1.2. Structure

The following components are addressed in this QCP:

- Condition inspection procedures used
- Accuracy required for data collection
- Inspector qualifications and experience
- Safety

2. Quality Control Plan

2.1. Condition Inspection Procedures

The governing document in performing condition inspections for the City of Santa Ana is ASTM D6433-11 "Standard Practice for Roads and Parking Lots Pavement Condition Index (PCI) Surveys." Both asphalt concrete (AC) and Portland cement concrete (PCC) pavements are included in this protocol. The following distresses are collected for each pavement type.

Asphalt Concrete (AC) Pavements

1. Alligator (fatigue) cracking
2. Bleeding
3. Block cracking
4. Bumps and sags
5. Corrugation
6. Depression
7. Edge cracking
8. Joint reflection cracking
9. Lane/Shoulder drop off
10. Longitudinal and transverse cracking
11. Patching and utility cut patching
12. Polished aggregate
13. Potholes
14. Railroad crossing
15. Rutting
16. Shoving
17. Slippage cracking
18. Swell
19. Weathering
20. Raveling

Portland Cement Concrete (Jointed)

1. Blowup/Buckling
2. Corner breaks
3. Divided slab
4. Durability ("D") cracking
5. Faulting
6. Joint seal damage
7. Lane/shoulder drop off
8. Linear cracking
9. Patching (large) and utility cuts
10. Patching (small)
11. Polished aggregate
12. Popouts
13. Pumping
14. Punchout
15. Railroad crossing
16. Scaling, map cracking and crazing
17. Shrinkage cracks
18. Spalling (corner)
19. Spalling (joint)

Any exceptions to the above procedures will be discussed with the City before any inspections are performed. These are usually related to distresses or situations that are not covered in the manuals. Examples include slippage cracks, roller check marks or edge cracking on streets with no curbs and gutters. Others include the use of seals or open-graded asphalt concrete mixes. Any modifications will be documented and submitted to the City for approval.

All distress or condition inspections are performed as walking inspections, and a minimum 10% sampling rate is utilized. Field crews are typically composed of a one-person crew teaming up when required for higher volume facilities such as arterials. The sample units for this project will be based upon the length and width of the street sections. This data will be collected to match the existing management sections of PAVER.

2.2. Accuracy Required For Data Collection

The accuracy required for data collection has two components, both of which are further described in the following paragraphs.

- Re-inspections
- PCI comparisons with past inspections

2.2.1 Re-Inspection "Check"

At least five percent of all inspections are randomly re-inspected by other team members. A different inspector will review these sites and determine the revised pavement distress measurements. If the initial inspection is determined to be inaccurate, the original inspector is given refresher training before being allowed to continue with any further inspections. Should the data be inaccurate for a certain day, all the data for that day will be re-inspected following refresher training to ensure accuracy.

Acceptability Criteria

At the time of re-inspection, the actual distresses will be re-inspected and verified, and any corrections made, if necessary. Distress types and severities must be the same and re-measured quantities within $\pm 10\%$ of the original measured quantity.

If corrections are required on more than 10% of the re-inspected sample units, then an additional 5% will be re-inspected. This will continue until all more than 95% of the re-inspected sections meet the acceptability criteria.

2.2.2 PCI Comparison with Past Inspections

As another level of quality control, the new PCIs are compared with the previous PCIs. If they differ by more than ± 10 PCI points, these sections are automatically flagged for further investigation.

If PCI Increases 10 points:

The section is investigated to see if a maintenance and rehabilitation event has occurred since the last inspection, but which has not been recorded. This can only be resolved with feedback from the City. Typically, it may include activities such as:

- Crack sealing activities – changes medium or high severity cracking to low severity
- Patching activities - alligator cracking that has been removed and patched, so that the resultant PCI is increased.
- Surface seals
- Overlay

Therefore, an up-to-date maintenance and rehabilitation history file in the PAVER database is desirable, both for historical accuracy as well as to provide additional quality control.

If PCI Decreases 10 points:

The section is checked to see if the average deterioration rate (usually 3 to 4 points per year) is exceeded. If the drop in PCI is within the range of what is acceptable, no further action is required. If the drop is more than the acceptable range, a re-inspection will be performed. The default performance curves in the pavement management software form the basis for what is acceptable.

2.3. Inspectors' Qualifications and Experience

All NCE's inspectors are required to attend formal training on condition distress inspections. For example, any of NCE's inspectors working on the LTPP project are required to attend a week-long training workshop every year to maintain their certifications. The Regional Transportation Commission (RTC) of Washoe County requires inspectors to be calibrated prior to performing any work using the ASTM D6433 protocols (also known as the pavement management inspections).

For pavement management (or ASTM D6433) inspections, NCE's technicians underwent the OCTA technician certification exercise held in May 2017.

Similarly, in agencies that use the Paver system, NCE's inspectors attend the distress training conducted by the Metropolitan Transportation Commission (MTC). After the formal training, they work with an experienced inspector before they are allowed to work on their own. Within the first month of working on their own, up to 20% of their work is checked weekly. Any necessary corrections are made immediately.

Finally, NCE conducts a one-day training and calibration workshop for all NCE staff involved with data collection. This is conducted once a year.

Inspector Name	Date of ASTM D-6433 Training	Training Conducted by:
David Na	March 6, 2017	Lisa K. Senn
Franc Escobedo	March 6, 2017	Lisa K. Senn
Meiling Cai	March 6, 2017	Lisa K. Senn

Resumes of technicians utilized on this project are included.

3. Safety Procedures

NCE administers a health and safety program in compliance with the Nevada Occupational Safety and Health Act (Section 618.383) and Cal OSHA Title VIII, Section 3203. The program is documented in NCE's *Workplace Safety Program Manual*.

Generally, the safety procedures include:

- Inspectors to wear a Class 2 safety vest at all times;
- Flashing beacon on all vehicles utilized for inspections; and
- Stopped vehicles to be parked at locations away from moving traffic (e.g. nearby parking, shoulders etc.).

On streets where there is a high volume of traffic or high speeds, additional measures may be necessary, such as:

- Inspections to occur during off-peak periods or on weekends;
- Additional inspector to watch out for traffic; and
- Traffic flaggers in extreme cases.

In extreme cases where it is not possible to walk on the pavement surface, inspections will be performed from sidewalks or raised medians. However, this is extremely rare for city or county roads/streets; this is most often encountered on state highways, and lane closures are the most likely option at this point.

All NCE inspectors are required to annually update their online safety programs as administered by "Click Safety". Class Taken are:

- C2 Cal PPE
- C2 Workzone Traffic Control
- C2 Workzone Traffic Safety Tips
- G2 Cal/OSHA Heat Illness

Resumes of Field Inspectors

Collaboration. Commitment. Confidence.SM

David J. Na, E.I.T
Staff Engineer

For the past several years, Mr. Na has been involved in a variety of projects providing a range of services from civil design and surveying to inspections and plan checks. While completing his undergraduate degree, he gained familiarity with multiple software programs such as HEC-HMS, SWMM, ArcGIS, and AutoCAD to name a few. Prior to joining NCE, Mr. Na was an engineering intern with the City of Costa Mesa.

Representative Projects

Mr. Na has performed numerous pavement condition inspections throughout California and performs all functions relating to pavement data collection using hardcopy forms or tablets. Mr. Na has also completed the OCTA MicroPAVER "Distress Identification" for both Asphalt Concrete and Portland Cement Pavements. Listed below are a collection of agencies for which Mr. Na has performed condition inspections.

Santa Monica	Marin County	Lake Forest
Carson	Anaheim	Mission Viejo
Stanton	Humboldt County

Pavement Management

Citywide Sidewalk Assessment | Staff Engineer

City of Carson, California

NCE conducted a citywide inspection in City of Carson for tripping hazards in the public right-of-way as well as ADA-compliance of curb ramps at street intersections. Field staff performed walking surveys and took photographs along the entire public sidewalk network. Mr. Na supported the concrete collection effort.

Pavement Management System Updates | Staff Engineer

Marin County, California

NCE is providing the annual pavement management system update for the County. Mr. Na performs all functions relating to data collection using paper forms or a tablet. As part of the quality control process, he performs cross-checks of data in the PMS database. He has performed quality control checks of field collected data and pavement maintenance history to ensure that PMS databases are accurate and up-to-date. During this process, Mr. Na also generates detailed reports, which are needed to help perform his cross-checks of the collected data.

Pavement Management System Updates | Staff Engineer

City of Santa Monica, California

NCE is providing the pavement management system update and GIS integration for the City of Santa Monica. The City's pavement network consists of 155 miles of paved roads of which 148 miles are asphalt concrete and seven miles are portland cement concrete. The City has utilized PAVER since 2003.

Stormwater and Hydrology

Hydrology Study & Storm Drain | *Project Manager*

University of California, Irvine

Mr. Na worked in conjunction with a consulting firm to conduct a Hydrology Study for Agua Chino Knolls using the Rational Method and the Unit Hydrograph Method in compliance with the Orange County Hydrology Manual as part of his senior design project.

Stormwater Drainage System | *Project Engineer*

University of California, Irvine

Mr. Na designed a stormwater drainage system for a local site plan using EPA SWMM software.

Water/Wastewater

Groundwater Contaminant Remediation Pump Station Design | *Project Engineer*

University of California, Irvine

Mr. Na developed a groundwater extraction/injection pumping system to mitigate contaminant/plume migration into underground aquifers for the El Toro Marine Corps Air Station.

Biological Process Design | *Project Engineer*

University of California, Irvine

Mr. Na completed a biological process design for full nitrification and denitrification and varied the MCRT during the yearly cycle to meet the monthly permit.

Roadway Infrastructure

Highway Design | *Project Engineer*

University of California, Irvine

Mr. Na designed a partial two-lane highway extension connecting the SR-241 Toll Road and SR-74 Ortega Highway.

Collaboration. Commitment. Confidence.SM

Fran Escobedo **Engineering Field Technician**

Mr. Franc Escobedo has over 15 years of experience as a pavement management technician for NCE. He has performed numerous pavement condition inspections throughout California, Idaho, and Washington. He experience includes distress collection across various Pavement Management Systems including the Metropolitan Transportation Commission StreetSaver, MicroPAVER, Cartegraph, and Hansen systems.

Additionally, Mr. Escobedo has completed both the OCTA MicroPAVER and MTC "Distress Identification" courses for both Asphalt Concrete and Portland Cement Pavements and now assists with the training of agency staff on both courses.

Mr. Escobedo performs all activities relating to pavement data collection using hardcopy forms or tablets. As part of the quality control process, he performs cross-checks of data in the PMS database. He also regularly performs quality control checks of field collected data and pavement maintenance history to ensure that PMS databases are accurate and up-to-date. During this process, he also generates detailed reports, which are necessary to perform his cross-checks of the collected data.

His field experience and expertise is an added benefit to agencies during field training. Listed below are a collection of agencies for which Mr. Escobedo has performed condition inspections – they total over 6,000 centerline miles of roads and streets.

Projects included various forms of inspections for pavement distress data collection, such as walking, windshield, and/or semi-automated.

Meiling Cai, E.I.T.

Staff Engineer

For Meiling Cai, the traffic and pavement-related courses she took during her sophomore year in college ended up being illuminating experiences that changed the direction of her education and career. After taking the classes, any time she would drive or go for a walk, Meiling "couldn't stop thinking about how to make the roads or signals better" as she observed pavement conditions, detection loops, and traffic flow. After joining the Institute of Transportation Engineers' Student Chapter and working on some projects, she decided to specialize in transportation, applying her interests and passions to her future career.

Meiling joined NCE upon graduation and has since performed pavement condition inspections throughout California and Idaho, as well as sidewalk and curb ramp assessments. Her experience includes distress collection across various pavement management systems.

She enjoys the process of continually learning and working to find better solutions. Meilings' clients value her attention to detail, spirit of collaboration, and the fact she truly cares about her work and its impact.

Representative Projects

Pavement and Asset Management

Sidewalk & Curb Ramp Assessment *City of Corona, California*

Field Technician. NCE performed condition assessments of approximately 350 centerline miles of sidewalks and 9,000 curb ramps. In addition, NCE provided prioritization criteria as well as repair recommendations.

Pavement Management System and Update *City of Whittier, California*

Field Technician. NCE provided the PMP implementation of 195 centerline miles. NCE performed the following tasks: Conversion of old pavement inventory into the StreetSaver® database; review of inventory data; performed condition inspections; PCI calculation; import of M&R history records; review of M&R strategies and costs; determine the funding needs of the road network; completion of multiple funding scenarios, linkage of the database to GIS, City staff training, and provided technical support.

Pavement Management Plan Updates *City of La Habra, California*

Field Technician. NCE is providing a comprehensive pavement condition inspection of the City's streets and alleys in order to prepare the 2015 update report to the Orange County Transportation Authority. Updates include the Pavement Condition Index, treatment, unit costs, and cost of all segments of the City's streets.

Pavement Management Plan Updates *City of Manhattan Beach, California*

Field Technician. NCE updated the City's Pavement Management Program including inspection/evaluation of approximately 120 centerline miles of paved streets, review and recommendation of revisions to the current pavement management strategies and costs as well as the preparation of a final Pavement Management Program report.

Pavement Management Plan Updates

City of El Centro, California

Field Technician. NCE developed the City's Pavement Management System including detailed inspection and evaluation of the City's streets and recommendations for maintenance methodologies and pavement treatment options.

Pavement Condition Inspection and Maintenance

City of Davis, California

Field Technician. NCE is providing inventory verification, pavement condition inspections, sidewalk assessments, review and evaluation of maintenance and rehabilitation decision strategies, budgetary analyses, GIS integration, and staff training for the University' pavement management program update.

Pavement Condition Inspection and Maintenance

Ada County Highway District, Idaho

Field Technician. NCE performed field pavement condition inspections on all the arterial and collectors (approximately 600 miles) as well as approximately 1,000 miles of residential streets. These were walking inspections as per the StreetSaver® protocols. NCE updated the StreetSaver® database with the distress data collected, calculated the pavement condition index, and provided training on the StreetSaver® program as well as a discussion of maintenance and rehabilitation treatments for County staff.

I. Pavement Management Plan Certification

The City of Santa Ana certifies that it has a Pavement Management Plan in conformance with the criteria stated in the Orange County Transportation Authority Ordinance No. 3. This ordinance requires that a Pavement Management Plan be in place and maintained to qualify for allocation of revenues generated from renewed Measure M (M2).

The plan was developed by City of Santa Ana* using StreetSaver, a pavement management system, conforming to American Society of Testing and Materials (ASTM) Standard D6433, and contains, at a minimum, the following elements:

- Inventory of MPAH and local routes reviewed and updated biennially. The last update of the inventory was completed on March, 2018 for Arterial (MPAH) streets and March, 2018 for local streets.
- Assessment of pavement condition for all routes in the system, updated biennially. The last field review of pavement condition was completed on March, 2018.
- Percentage of all sections of pavement needing:
 - Preventative Maintenance: 65.9%
 - Rehabilitation: 26.7%
 - Reconstruction: 7.4%
- Budget needs for Preventative Maintenance, Rehabilitation, and/or Reconstruction of deficient sections of pavement for:
 - Current biennial period \$190.7 million
 - Following biennial period \$17.1 million
- Funds budgeted or available for Preventative Maintenance, Rehabilitation, and/or Reconstruction:
 - Current biennial period \$24.8 million
 - Following biennial period \$10.3 million
- Backlog by year of unfunded pavement rehabilitation, restoration, and reconstruction needs.
- The Pavement Management Plan is consistent with countywide pavement condition assessment standards as described in the OCTA Countywide Pavement Management Plan Guidelines adopted by the OCTA Board of Directors.

*An electronic copy of the Pavement Management Plan (with Micro Paver or StreetSaver compatible files) has been, or will be, submitted with the certification statement.

A copy of this certification is being provided to the Orange County Transportation Authority.

II. Executive Summary

The City of Santa Ana (City) Public Works Agency utilizes StreetSaver and geographical information system (GIS) to develop the Pavement Management Program (PMP) to provide an accurate inventory of the current and projected pavement condition of all public roadways and to implement a seven-year roadway maintenance and rehabilitation (M&R) program to maximize the return from available existing funding for street pavement. The PMP's ultimate goal is to effectively strategize short and long-term usages of current and future limited funding to restore and maintain the entire street pavement network at "Good" condition or better.

The City currently manages 422.8 centerline miles of streets for a total of approximately 95.7 million square feet (SF) of paved surfaces. To be consistent with the City General Plan Circulation Element Master Plan of Streets and Highways and the Orange County Transportation Authority (OCTA) Master Plan of Arterial Highways (MPAH), the entire street pavement network is organized into two networks (arterial and local) depending on its functional classifications (i.e. major, primary, secondary, and collector arterial streets; residential and non-residential local streets). There are 106.2 centerline miles (25% of entire pavement network) in the arterial network and 316.6 centerline miles (75% of entire pavement network) in the local network. To assist planning maintenance needs, the streets are also arranged into over 4,300 sections and classified by surface types – Asphalt Concrete (AC) or Portland Cement Concrete (PCC).

Figure E-1: PCI Distribution for 2016 and 2018

Pavement condition inspections are performed biennially for both the arterial and local networks. Figure E-1 shows a comparison of the Pavement Condition Index (PCI) distribution between the 2016 and the 2018 inspections. The PCI is a numerical value ranging from 0 for deteriorated pavement with virtually no remaining life to 100 for new or recently rehabilitated pavement. Generally, the PCI value is expressed as an area-weighted PCI (PCI_{aw}) to provide a more representative value. A PCI value is computed for each street section based on the pavement distresses found within that section during an inspection. Inspections provide the data utilized in analysis and surface treatment recommendations for each street section; however, the PCI values shall be utilized for planning purposes in determining the surface treatment types and are not intended to replace sound engineering judgment. In general, the City's strategies involve the utilization of surface seals, such as crack sealing or slurry sealing for preventive maintenance and rehabilitation (M&R) of streets in "Good" condition and major M&R plans typically consist of overlays, such as thin overlays, for "Fair" condition streets; resurfacing, such as structural overlays or cold-in-place recycling (CIR), for "Poor" condition streets; and reconstruction, such as cement-treated base (CTB) or full depth reconstruction (FDR), for "Very Poor" condition streets.

A fully-integrated PMP has had a positive effect on improving the City's entire pavement network by developing efficient M&R strategies and analyzing the effect of various funding alternatives on the pavement conditions. The strategies include forecasting optimal time for M&R needs, providing cost-effective alternatives for halting the deterioration of existing pavement, improving the overall condition of the entire pavement network, and reducing the backlog of M&R work over the next seven years. To carry forward one of the City's main objectives in providing a safe, reliable, efficient, and comfortable driving environment, this PMP report analyzes various M&R strategies, the effect of the City's existing Capital Improvement Program (CIP) funding on the street pavement system, and projected funding to both maintain and improve existing PCI_{aw} over a seven-year plan.

With existing funding of approximately \$59.3 million for the entire pavement network over the seven-year period from Fiscal Year (FY) 2018/19 through FY 2024/25, the entire pavement network existing PCI_{aw} of 78 is projected to decrease by 10 percent to 70 at the end of the seven-year cycle under existing funding levels. Individually, the arterial and local networks are projected to experience a similar decrease in existing PCI_{aw} , 15 percent and 10 percent, respectively. Furthermore, the backlog for the entire pavement network is projected to increase by 89 percent from \$146.4 million in the first year to \$276.4 million in the seventh year.

If the existing PCI_{aw} of 78 were to be maintained at the end of the seven-year cycle, a total of \$103.2 million in additional funds calculated at about \$14.7 million annually would be required; thus providing for a total alternative funding level of just over \$162.5 million through FY 2024/25. The additional funding would be applied to both the arterial and local networks at 46.7 percent (\$48.2 million) and 53.3 percent (\$55 million), respectively. Furthermore, with this additional funding, the backlog for the entire pavement network is projected to diminish by 3 percent from \$146.4 million in the first year to \$141.8 million in the seventh year.

If the existing PCI_{aw} were to be improved by 1 point to 79 at the end of the seven-year cycle, a total of \$120.6 million in additional funds calculated at about \$17.2 million annually would be required; thus providing for a total alternative funding level of over \$179.9 million through FY 2024/25. The additional funding would be applied to both the arterial and local networks at 46.4 percent (\$55.9 million) and 53.6 percent (\$64.7 million), respectively. Furthermore, with this additional funding, the backlog for the entire pavement network is projected to diminish by 18 percent from \$146.4 million currently to \$119.9 million in the seventh year.

Overall, the conclusion drawn from this PMP report is that the backlog for the entire pavement network is evenly distributed across both the arterial and the local network. Additionally, existing funding levels in the City CIP will not keep pace with rehabilitation needs over the next seven years. Since preserving street condition and performance should be a priority to provide motorists with safety assurances, the City's goal over the next seven years is to acquire sufficient pavement M&R funding to sustain the entire street pavement network at "Good" condition or better. By achieving this goal, the City will remain eligible for the reduced local match requirements for the renewed Measure M2 Competitive grant until FY 2024/25.

III. Background (Optional)

The City owns and maintains approximately 422.8 centerline miles of street pavements, which includes 106.2 miles of MPAH streets, and 316.6 miles of local streets. The City converts its PAVER pavement management database to StreetSaver in 2017 to better manage its street network. Pavement distress data is collected in compliance with ASTM D6433-11¹ as outlined by the OCTA in the "Countywide Pavement Management Plan Guidelines", Chapter 2².

¹ ASTM. "ASTM D6433-11." Standard Practice for Roads and Parking Lots Pavement Condition Index Inspections

² OCTA. "Pavement Management Program Guidelines." *Countywide Pavement Management Program Guidelines Manual*.

IV. Current Pavement Conditions (PCI)

Current Network PCI	Current MPAH PCI	Current Local PCI
78	73	81

V. Projected Pavement Conditions (PCI)

Should be by projected PCI by year under existing or expected funding levels for next seven fiscal years ("Today" is before June 30).

Fiscal Year	Current Funding (\$ million)	Entire Network PCI	MPAH PCI	Local PCI
Today	N/A	78	73	81
2018-19	11.3	79	74	81
2019-20	13.5	77	73	79
2020-21	5.0	75	70	78
2021-22	5.3	74	69	77
2022-23	12.9	72	67	76
2023-24	5.7	71	65	75
2024-25	5.6	70	63	73

VI. Alternative Funding Levels

Maintain Existing Average Network PCI

Fiscal Year	Funding Needed † (\$ million)	Entire Network PCI	MPAH	Local

Improve Average Network PCI

Fiscal Year	Funding Needed (\$ million)	Entire Network PCI	MPAH	Local
Today	N/A	78	73	81
2018-19	33.0	81	77	83
2019-20	28.5	80	77	82
2020-21	20.4	80	76	82
2021-22	19.9	79	76	81
2022-23	30.0	79	76	81
2023-24	24.0	79	75	82
2024-25	24.0	79	74	83

VII. Current and Projected Backlog by Year of Pavement Maintenance Needs

Fiscal Year	Current Funding Backlog (\$ million)	Maintain PCI Backlog (\$ million)	Increase PCI Backlog (\$ million)
Current	146.4	146.4	146.4
2018-19	146.4	126.9	124.9
2019-20	163.8	129.5	126.7
2020-21	182.0	134.0	128.3
2021-22	204.0	137.0	128.3
2022-23	229.4	140.7	128.3
2023-24	255.7	145.1	129.2
2024-25	276.4	141.8	119.9

VIII. Centerline Mileage

Entire Pavement Network	MPAH	Local Roads
422.8	106.2	316.6

IX. Percentage of Network in Each of Five Condition Categories Based on Centerline Miles

Condition Category	PCI Range	Network	Percent Area of Total Pavement	Area of Pavement (sf)	Percent Centerline Mileage of Network	Centerline Mileage of Network
Very Good	86-100	MPAH	9.5%	9,122,037	51.4%	25.9
		Local	36.8%	35,178,908		191.6
Good	75-85	MPAH	9.0%	8,586,822	18.6%	24.3
		Local	10.7%	10,213,567		54.2
Fair	60-74	MPAH	11.7%	11,221,247	15.9%	33.9
		Local	6.6%	6,341,701		33.4
Poor	41-59	MPAH	4.7%	4,456,626	6.9%	11.8
		Local	3.7%	3,544,244		17.2
Very Poor	0-40	MPAH	3.1%	2,972,564	7.2%	10.3
		Local	4.2%	4,064,475		20.2

X. Reduction in M2 Local Match

A local agency match reduction of 10% of the eligible cost for projects submitted for consideration of funding through the M2 Comprehensive Transportation Funding Programs (CTFP) call for projects is available if the local agency either:

- a. Shows measurable improvement of paved road conditions during the previous reporting period defined as an overall weighted (by area) average system improvement of one Pavement Condition Index (PCI) point with no reduction in the overall weighted (by area) average PCI in the Master Plan of Arterial Highways (MPAH) or local street categories;

or

- b. Have road pavement conditions during the previous reporting period, within the highest 20% of the scale for road pavement conditions in conformance with OCTA Ordinance No. 3, defined as a PCI of 75 or higher, otherwise defined as in "good condition".

If applicable, please use the space below to justify the local agency's eligibility for a reduction in M2 Local Match based on the statement above.

The City of Santa Ana has met the criteria above by having an average weighted PCI of 78. This means the City continues to remain eligible for M2 funding.

XI. Appendix A – Seven-Year Road Maintenance and Rehabilitation Plan Based on Current *or* Expected Funding Level

The seven-year plan for road maintenance and rehabilitation should be based on current and projected budget. Street sections selected for treatment should be identified here. Specific data to be submitted should follow the format below:

MPAH								
Limits of Work								
Street Name	From	To	Length of Segment	Width of Segment	Pavement Area	Type of Treatment	Cost of Treatment	Year of Treatment

LOCAL								
Limits of Work								
Street Name	From	To	Length of Segment	Width of Segment	Pavement Area	Type of Treatment	Cost of Treatment	Year of Treatment

Please attach the seven-year road maintenance and rehabilitation plan, following the above template, after this sheet. The plan should be labeled Appendix A.

XII. Appendix B – Complete Street Listing Current Conditions

A complete street listing of current pavement conditions should be included in this report. Specific data to be submitted should follow the format below:

MPAH						
Street Name	From	To	Width of Segment	Area	Current PCI	Most Recent Inspection Date

LOCAL						
Street Name	From	To	Width of Segment	Area	Current PCI	Most Recent Inspection Date

Please attach the complete street listing, following the above template, after this sheet. The pages should be labeled Appendix B.

XIII. Appendix C – Quality Assurance/Quality Control Plan

Introduction

When performing data collection in any field, the need for quality control is paramount as it is essential for accurate planning, analysis and design. This is particularly true for collecting pavement distress data for a pavement management system.

The Quality Assurance/Quality Control (QA/QC) Plan establishes minimum quality standards for performance and procedures for updates of the pavement management system.

If applicable, utilize the space below to include information on the agency's QA/QC policies:

Appendix A - Resumes of Field Inspectors

1. Introduction

When performing data collection in any field, the need for quality control is paramount. This need for quality data is essential for accurate planning, analysis and design. NCE's "Quality Assurance Management Plan" (QAMP) affirms that:

"NCE is dedicated to achieving technical and management excellence and to delivering professional engineering and environmental services that meet or exceed our clients' needs. NCE's Quality Assurance/Quality Control (QA/QC) Program is designed to achieve these goals. This QA Management Plan (QAMP) describes NCE's QA Program, which is based on four principles: client satisfaction, employee participation, problem prevention, and continuous quality improvements."

NCE's QAMP establishes minimum quality standards for performance and procedures for assuring that our clients receive quality service. It requires the participation of employees at every level. It encourages Project Managers and technical staff to take pride in their work and responsibility for ensuring that the work is done correctly the first time. The program is designed to reduce the incidence of problems related to quality and results in implementation, where necessary, of corrective actions and modification of work procedures to minimize the incidence of future problems.

NCE has also prepared detailed and specific Quality Control Plans for projects, and the most notable example is for the **Long Term Pavement Performance (LTPP) – Western Regional Support Contract** for the Federal Highway Administration. This is a 150 page document that covers data collection on highways, including deflection, profile, pavement distresses, traffic, maintenance and rehabilitation history, materials testing and sampling as well as a document control.

1.1. Objectives

This document constitutes a formal Quality Control Plan (QCP) for the City of Santa Ana. The focus is on data collection issues as part of the pavement management update.

Specifically, it is intended for the 2017/2018 Pavement Management Update. The focus is on the collection of network-level pavement distress data (defined by NCHRP Synthesis 401 *Quality Management of Pavement Data Collection*, as "Network-level data collection involves collection of large quantities of pavement condition data, which is often converted to individual condition indices or aggregated into composite condition indices.")

1.2. Structure

The following components are addressed in this QCP:

- Condition inspection procedures used
- Accuracy required for data collection
- Inspector qualifications and experience
- Safety

2. Quality Control Plan

2.1. Condition Inspection Procedures

The governing document in performing condition inspections for the City of Santa Ana is ASTM D6433-11 "Standard Practice for Roads and Parking Lots Pavement Condition Index (PCI) Surveys." Both asphalt concrete (AC) and Portland cement concrete (PCC) pavements are included in this protocol. The following distresses are collected for each pavement type.

Asphalt Concrete (AC) Pavements

1. Alligator (fatigue) cracking
2. Bleeding
3. Block cracking
4. Bumps and sags
5. Corrugation
6. Depression
7. Edge cracking
8. Joint reflection cracking
9. Lane/Shoulder drop off
10. Longitudinal and transverse cracking
11. Patching and utility cut patching
12. Polished aggregate
13. Potholes
14. Railroad crossing
15. Rutting
16. Shoving
17. Slippage cracking
18. Swell
19. Weathering
20. Raveling

Portland Cement Concrete (Jointed)

1. Blowup/Buckling
2. Corner breaks
3. Divided slab
4. Durability ("D") cracking
5. Faulting
6. Joint seal damage
7. Lane/shoulder drop off
8. Linear cracking
9. Patching (large) and utility cuts
10. Patching (small)
11. Polished aggregate
12. Popouts
13. Pumping
14. Punchout
15. Railroad crossing
16. Scaling, map cracking and crazing
17. Shrinkage cracks
18. Spalling (corner)
19. Spalling (joint)

Any exceptions to the above procedures will be discussed with the City before any inspections are performed. These are usually related to distresses or situations that are not covered in the manuals. Examples include slippage cracks, roller check marks or edge cracking on streets with no curbs and gutters. Others include the use of seals or open-graded asphalt concrete mixes. Any modifications will be documented and submitted to the City for approval.

All distress or condition inspections are performed as walking inspections, and a minimum 10% sampling rate is utilized. Field crews are typically composed of a one-person crew teaming up when required for higher volume facilities such as arterials. The sample units for this project will be based upon the length and width of the street sections. This data will be collected to match the existing management sections of PAVER.

2.2. Accuracy Required For Data Collection

The accuracy required for data collection has two components, both of which are further described in the following paragraphs.

- Re-inspections
- PCI comparisons with past inspections

2.2.1 Re-Inspection "Check"

At least five percent of all inspections are randomly re-inspected by other team members. A different inspector will review these sites and determine the revised pavement distress measurements. If the initial inspection is determined to be inaccurate, the original inspector is given refresher training before being allowed to continue with any further inspections. Should the data be inaccurate for a certain day, all the data for that day will be re-inspected following refresher training to ensure accuracy.

Acceptability Criteria

At the time of re-inspection, the actual distresses will be re-inspected and verified, and any corrections made, if necessary. Distress types and severities must be the same and re-measured quantities within $\pm 10\%$ of the original measured quantity.

If corrections are required on more than 10% of the re-inspected sample units, then an additional 5% will be re-inspected. This will continue until all more than 95% of the re-inspected sections meet the acceptability criteria.

2.2.2 PCI Comparison with Past Inspections

As another level of quality control, the new PCIs are compared with the previous PCIs. If they differ by more than ± 10 PCI points, these sections are automatically flagged for further investigation.

If PCI Increases 10 points:

The section is investigated to see if a maintenance and rehabilitation event has occurred since the last inspection, but which has not been recorded. This can only be resolved with feedback from the City. Typically, it may include activities such as:

- Crack sealing activities – changes medium or high severity cracking to low severity
- Patching activities - alligator cracking that has been removed and patched, so that the resultant PCI is increased.
- Surface seals
- Overlay

Therefore, an up-to-date maintenance and rehabilitation history file in the PAVER database is desirable, both for historical accuracy as well as to provide additional quality control.

If PCI Decreases 10 points:

The section is checked to see if the average deterioration rate (usually 3 to 4 points per year) is exceeded. If the drop in PCI is within the range of what is acceptable, no further action is required. If the drop is more than the acceptable range, a re-inspection will be performed. The default performance curves in the pavement management software form the basis for what is acceptable.

2.3. Inspectors' Qualifications and Experience

All NCE's inspectors are required to attend formal training on condition distress inspections. For example, any of NCE's inspectors working on the LTPP project are required to attend a week-long training workshop every year to maintain their certifications. The Regional Transportation Commission (RTC) of Washoe County requires inspectors to be calibrated prior to performing any work using the ASTM D6433 protocols (also known as the pavement management inspections).

For pavement management (or ASTM D6433) inspections, NCE's technicians underwent the OCTA technician certification exercise held in May 2017.

Similarly, in agencies that use the Paver system, NCE's inspectors attend the distress training conducted by the Metropolitan Transportation Commission (MTC). After the formal training, they work with an experienced inspector before they are allowed to work on their own. Within the first month of working on their own, up to 20% of their work is checked weekly. Any necessary corrections are made immediately.

Finally, NCE conducts a one-day training and calibration workshop for all NCE staff involved with data collection. This is conducted once a year.

Inspector Name	Date of ASTM D-6433 Training	Training Conducted by:
David Na	March 6, 2017	Lisa K. Senn
Franc Escobedo	March 6, 2017	Lisa K. Senn
Meiling Cai	March 6, 2017	Lisa K. Senn

Resumes of technicians utilized on this project are included.

3. Safety Procedures

NCE administers a health and safety program in compliance with the Nevada Occupational Safety and Health Act (Section 618.383) and Cal OSHA Title VIII, Section 3203. The program is documented in NCE's *Workplace Safety Program Manual*.

Generally, the safety procedures include:

- Inspectors to wear a Class 2 safety vest at all times;
- Flashing beacon on all vehicles utilized for inspections; and
- Stopped vehicles to be parked at locations away from moving traffic (e.g. nearby parking, shoulders etc.).

On streets where there is a high volume of traffic or high speeds, additional measures may be necessary, such as:

- Inspections to occur during off-peak periods or on weekends;
- Additional inspector to watch out for traffic; and
- Traffic flaggers in extreme cases.

In extreme cases where it is not possible to walk on the pavement surface, inspections will be performed from sidewalks or raised medians. However, this is extremely rare for city or county roads/streets; this is most often encountered on state highways, and lane closures are the most likely option at this point.

All NCE inspectors are required to annually update their online safety programs as administered by "Click Safety". Class Taken are:

- C2 Cal PPE
- C2 Workzone Traffic Control
- C2 Workzone Traffic Safety Tips
- G2 Cal/OSHA Heat Illness

Resumes of Field Inspectors

David J. Na, E.I.T
Staff Engineer

For the past several years, Mr. Na has been involved in a variety of projects providing a range of services from civil design and surveying to inspections and plan checks. While completing his undergraduate degree, he gained familiarity with multiple software programs such as HEC-HMS, SWMM, ArcGIS, and AutoCAD to name a few. Prior to joining NCE, Mr. Na was an engineering intern with the City of Costa Mesa.

Representative Projects

Mr. Na has performed numerous pavement condition inspections throughout California and performs all functions relating to pavement data collection using hardcopy forms or tablets. Mr. Na has also completed the OCTA MicroPAVER "Distress Identification" for both Asphalt Concrete and Portland Cement Pavements. Listed below are a collection of agencies for which Mr. Na has performed condition inspections.

Santa Monica	Marin County	Lake Forest
Carson	Anaheim	Mission Viejo
Stanton	Humboldt County	

Pavement Management

Citywide Sidewalk Assessment | Staff Engineer
City of Carson, California

NCE conducted a citywide inspection in City of Carson for tripping hazards in the public right-of-way as well as ADA-compliance of curb ramps at street intersections. Field staff performed walking surveys and took photographs along the entire public sidewalk network. Mr. Na supported the concrete collection effort.

Pavement Management System Updates | Staff Engineer
Marin County, California

NCE is providing the annual pavement management system update for the County. Mr. Na performs all functions relating to data collection using paper forms or a tablet. As part of the quality control process, he performs cross-checks of data in the PMS database. He has performed quality control checks of field collected data and pavement maintenance history to ensure that PMS databases are accurate and up-to-date. During this process, Mr. Na also generates detailed reports, which are needed to help perform his cross-checks of the collected data.

Pavement Management System Updates | Staff Engineer
City of Santa Monica, California

NCE is providing the pavement management system update and GIS integration for the City of Santa Monica. The City's pavement network consists of 155 miles of paved roads of which 148 miles are asphalt concrete and seven miles are portland cement concrete. The City has utilized PAVER since 2003.

Stormwater and Hydrology

Hydrology Study & Storm Drain | *Project Manager*

University of California, Irvine

Mr. Na worked in conjunction with a consulting firm to conduct a Hydrology Study for Agua Chinon Knolls using the Rational Method and the Unit Hydrograph Method in compliance with the Orange County Hydrology Manual as part of his senior design project.

Stormwater Drainage System | *Project Engineer*

University of California, Irvine

Mr. Na designed a stormwater drainage system for a local site plan using EPA SWMM software.

Water/Wastewater

Groundwater Contaminant Remediation Pump Station Design | *Project Engineer*

University of California, Irvine

Mr. Na developed a groundwater extraction/injection pumping system to mitigate contaminant/plume migration into underground aquifers for the El Toro Marine Corps Air Station.

Biological Process Design | *Project Engineer*

University of California, Irvine

Mr. Na completed a biological process design for full nitrification and denitrification and varied the MCRT during the yearly cycle to meet the monthly permit.

Roadway Infrastructure

Highway Design | *Project Engineer*

University of California, Irvine

Mr. Na designed a partial two-lane highway extension connecting the SR-241 Toll Road and SR-74 Ortega Highway.

Collaboration. Commitment. Confidence.SM

Franco Escobedo **Engineering Field Technician**

Mr. Franco Escobedo has over 15 years of experience as a pavement management technician for NCE. He has performed numerous pavement condition inspections throughout California, Idaho, and Washington. He experience includes distress collection across various Pavement Management Systems including the Metropolitan Transportation Commission StreetSaver, MicroPAVER, Cartograph, and Hansen systems.

Additionally, Mr. Escobedo has completed both the OCTA MicroPAVER and MTC "Distress Identification" courses for both Asphalt Concrete and Portland Cement Pavements and now assists with the training of agency staff on both courses.

Mr. Escobedo performs all activities relating to pavement data collection using hardcopy forms or tablets. As part of the quality control process, he performs cross-checks of data in the PMS database. He also regularly performs quality control checks of field collected data and pavement maintenance history to ensure that PMS databases are accurate and up-to-date. During this process, he also generates detailed reports, which are necessary to perform his cross-checks of the collected data.

His field experience and expertise is an added benefit to agencies during field training. Listed below are a collection of agencies for which Mr. Escobedo has performed condition inspections - they total over 6,000 centerline miles of roads and streets.

Projects included various forms of inspections for pavement distress data collection, such as walking, windshield, and/or semi-automated.

Meiling Cai, E.I.T.

Staff Engineer

For Meiling Cai, the traffic and pavement-related courses she took during her sophomore year in college ended up being illuminating experiences that changed the direction of her education and career. After taking the classes, any time she would drive or go for a walk, Meiling "couldn't stop thinking about how to make the roads or signals better" as she observed pavement conditions, detection loops, and traffic flow. After joining the Institute of Transportation Engineers' Student Chapter and working on some projects, she decided to specialize in transportation, applying her interests and passions to her future career.

Meiling joined NCE upon graduation and has since performed pavement condition inspections throughout California and Idaho, as well as sidewalk and curb ramp assessments. Her experience includes distress collection across various pavement management systems.

She enjoys the process of continually learning and working to find better solutions. Meilings' clients value her attention to detail, spirit of collaboration, and the fact she truly cares about her work and its impact.

Representative Projects

Pavement and Asset Management

Sidewalk & Curb Ramp Assessment

City of Corona, California

Field Technician. NCE performed condition assessments of approximately 350 centerline miles of sidewalks and 9,000 curb ramps. In addition, NCE provided prioritization criteria as well as repair recommendations.

Pavement Management System and Update

City of Whittier, California

Field Technician. NCE provided the PMP implementation of 195 centerline miles. NCE performed the following tasks: Conversion of old pavement inventory into the StreetSaver® database; review of inventory data; performed condition inspections; PCI calculation; import of M&R history records; review of M&R strategies and costs; determine the funding needs of the road network; completion of multiple funding scenarios, linkage of the database to GIS, City staff training, and provided technical support.

Pavement Management Plan Updates

City of La Habra, California

Field Technician. NCE is providing a comprehensive pavement condition inspection of the City's streets and alleys in order to prepare the 2015 update report to the Orange County Transportation Authority. Updates include the Pavement Condition Index, treatment, unit costs, and cost of all segments of the City's streets.

Pavement Management Plan Updates

City of Manhattan Beach, California

Field Technician. NCE updated the City's Pavement Management Program including inspection/evaluation of approximately 120 centerline miles of paved streets, review and recommendation of revisions to the current pavement management strategies and costs as well as the preparation of a final Pavement Management Program report.

Pavement Management Plan Updates
City of El Centro, California

Field Technician. NCE developed the City's Pavement Management System including detailed inspection and evaluation of the City's streets and recommendations for maintenance methodologies and pavement treatment options.

Pavement Condition Inspection and Maintenance
City of Davis, California

Field Technician. NCE is providing inventory verification, pavement condition inspections, sidewalk assessments, review and evaluation of maintenance and rehabilitation decision strategies, budgetary analyses, GIS integration, and staff training for the University' pavement management program update.

Pavement Condition Inspection and Maintenance
Ada County Highway District, Idaho

Field Technician. NCE performed field pavement condition inspections on all the arterial and collectors (approximately 600 miles) as well as approximately 1,000 miles of residential streets. These were walking inspections as per the StreetSaver® protocols. NCE updated the StreetSaver® database with the distress data collected, calculated the pavement condition index, and provided training on the StreetSaver® program as well as a discussion of maintenance and rehabilitation treatments for County staff.

XIV. Appendix D – Pavement Management Data Files

The Pavement Management data files shall be submitted to OCTA in spreadsheet format. This must include the following information:

- Street name and limits for all public streets
- Street identifiers (Branch ID, Section ID)
- Direction (if applicable)
- Beginning and ending of each section
- Length, widths, and true areas
- Functional Classification (MPAH, Local)
- Number of travel lanes
- PCI and date of inspection
- Type of recommended treatment
- Cost of recommended treatment

The Pavement Management data files are attached here as a CD, or included as Appendix D

XV. Appendix E – GIS Maps – Current Conditions (Optional)

If included, attach and label Appendix E.
